If we are damned, it is for sure that the best poker games and bull
sessions will be in Hell.

A common problem among those who quit smoking and are faced with the fact
that the Non-smoking side of the restaurant is full of creeping cadavers
of all ages and conditions while all the interesting people are behind the

smoke cloud. I propose we rename the AKCs the Creeping Cadavers, or with a tip of the hat to the late Gene Shepard, Creeping Meatballs.

It is also no longer precisely true that I 'don't use CB'. I have a half-dozen junkers busily receiving in the 28.0-28.2 range with the rf coils retuned to the image where they were not already modded reporting AGC voltages to mama. Most were killed by Golden Screwdrivers but who cares. Some of the mods appear to have been done with a blowtorch and broadaxe. We have a virtually endless supply from the local CB dealer so I may become the resident genius on freq mods without ever putting one on the air. Sic Semper and all that.

Being damned one more time is not a big deal. As it happens my last name was on the first of the post WW2 religion-in-the-schools cases about the time I was starting school so getting a hard time from the God Squad (and I am not related) no matter what the subject is a fairly normal state of affairs.

Dick N&#65533;BK

3. This is some funny shit! LOL Keep up the great work, Aaron.

I have the following amps for sale, all in great condition
Texas Star 250 $125
Texas Star 1 pill $ 50
No Name 5 LB Maul with auto SSB, rec amp and external jacks for power and
rec amp. Like new $300
Thunderbolt 305 base amp 1 driving 3 6LQ6's. This is a great amp $300.
I am selling these amps due to illness
If interested or have any questions email me, Steve

I am going to assume that your purpose is to make the limiter disappear.
If not, smack me with a potful of wet noodles (preferably without the pot)
and we'll be even.

You really don't want to do that. There are two good reasons for saying
that no matter what your supposedly techie friends tell you.

1) The limiter is probably set pretty close to 100% modulation now. It is
called 100% percent because a given carrier level will not support
anything more than half its power in audio on it and even if it could the
receiver will not demodulate it so it is pointless. When you try to feed
more audio to a final at some point you try to make the final produce
'negative power' and rather than enter the twilite zone it flips you off
and turns the excess power into spurious crap, sidebands wider than the
receiver will accept, and what is called because it looks that way on a
scope, buckshot. If the object of the game is to make a speaker rattle,
clipping the limiter is not the way to get it done.

2) Now that 'half the carrier power' limit applies only at the peaks and
as it happens the human voice has an 'peak to average' ratio of about 4 or
5 to 1. Said another way, you are only getting 20-25% average audio if
you don't step into the situation. It might surprise you to know that the
way the broadcast stations get loud audio is with what is called a
'brick-wall limiter'; they let the limiter handle the peaks and whack the
audio against the limiter til it bawls. So they come close to tripling
their average audio; now you know why there is no dynamic range on
W-I-N-O, Wonderful Wino.

Now getting it that far does take some sophisticated gizmos but that is in
fact what your CB does and it can get it into the 50% range that way
fairly easily. You should have figured out by now that clipping the
limiter actually costs you about half of your 'talk power'. This is
definitely not how to run a freight train.

Now if you really want to get me started, just bring up swingy audio or
'swang'.

The history of electronics and AM in particular is littered with bad
terminology which leads to ideas like limiter-clipping. And no good
red-blooded American likes limitation. But this is one place you are well

advised to leave it the hell alone.

The three rules of Technicianing: 1) know when to quit. 2) know when never to start 3) don't try to out-engineer the man who built it armed with two fanzines and a parts catalog.

Dick N&#65533;BK

7. Need More Exposure...

Newsgroup: rec.radio.cb
Date: 2002-06-01 01:58:09 UTC
From: Professor <bgriffey@core.com>
Message-ID: <3cf82a07$0$3332$1dc6e903@news.corecomm.net>
Source record: 125913

There are currently 11 (new design) SkyWave amplifiers in use across the US...
In an effort to get some additional units out in the field so that the SkyWave amp can get more exposure, I have slashed the price (below my manufacturing cost) to make a number of these units from the last production run available to even those on a tight budget! The units come with schematic and documentation. Specifications, photos, and special pricing information can be seen at the link below...

I hope you will take advantage of this limited offer to see that I'm serious about producing a high quality product with excellent reliability and very low harmonic content...

Message-ID: <ad9c28$1g6$1@newsg1.svr.pol.co.uk>
Source record: 125915

For weeks now, Aaron H. Voobner <voobner@yahoo.com> has
spammed newsgroups with crud such as...

> just admit to being (at some time or another) a brummie,

> Not so fast there my brummie

> I see...so you will deny your brummie connection to your dying day.

> A Brummie is simply a person from Birmingham,

> Why should one believe ANYTHING a brummy says?

> a bloody nerk, a daft sod, and a brummy

> dropped his pastie.

> reaction to being called a "brummy"

> you are a brummie and ashamed of it.

> your Brummie-ness

> you guessed it...Birmingham.

> deathly ashamed of being a Brummie

> "brummie" fantasy

And what made Aaron think I was in Birmingham?

> Never have I mentioned using any software.

No "ping" or "Neotrace"... He just dreamed it up.
And that great proof of how well Aaron debates an issue...

> Sod off.

So, Aaron H. Voobner, forgetting his OWN OBSESSION then wrote
>
> Awfully sensitive about Birmingham aren't you old chap?
===

No, I have no reason to be.

However, you have a serious problem with "Brummies", don't you old chap.
Not only did YOU bring up the subject, but YOU keep it going with your
fantasies.

You really need to get help with distinguishing between real life and your
dreams about being a secret agent.

Hey, Agent Aaron...
What colour is your Super-Hero cape, did Ludmilla use an
old table cloth to give it a pretty lace effect on the edges for you?

Do you use it as a "comfort blanket" at night, while you dream of being
a Secret Agent for the FCC... dedicated to tracking down the most wanted,
fearsom dangerous and evil people known to Americans... Brummies.

Brainbuster.

Hi All,

I have a PROMINENT 23 Channel Cb here.
I don't know if it works or not.

Maybe some-one here will want to play around with it?.

Could use a new mic, I have no way to power it up to see if it goes as there is no wires.

What would I need to use as a power source?.

Can I plug it into house current? <--ZAPPPPP!!!!, I Not think that a good plan.

Anyway i have no need for it, So it's free to a good home.

For info I live in Toronto,Ontario.

P.S. It has no mounting brackets, sorry

I have it set the same as my work machine. I wonder if it has somthing to do with the particular news server I'm using. My work QTH went through a different news server than the one I use at home. Since my work place upgraded to a full T1 Internet connection I can't use the company's old ISP's news server because our current Internet ISP is a different company.

I see your point. There are rule busters on both sides of the fence, I feel there are far fewer of them on the Ham side however.

I will say again, where is my unit. I would need to pad the input so My 4 Watt AM siginal (16 Watts P-P) would fit nicley into the power in verses power out curve.I would get 4 watts in 40 watts out and 16 watts in P-P 160 watts P-P out, or 12-16 watts P-P SSB mode in 120 -160 watts P-P SSB out. a good clean 10-12 db gain.

15. Kenrich Golden Eagle 750 and 1000 linear amplifier

Newsgroup: rec.radio.cb
Date: 2002-06-01 04:02:09 UTC
From: ka2tus@aol.com
Message-ID: <20020601000209.03137.00002409@mb-da.aol.com>
Source record: 125921

I am currently modifying the above referenced multi-tube linear amp. I need parts. does anyone have one of these amps that I can purchase: working or not. Also, I have the schematics for these two amps that I will provide for free to anyone who is interested in these two fine Kenrich linears. No need to buy a schematic from a "PROFESSIONAL CB'er (Maycom, etc.).

WHAT EVER HAPPENED TO "GOOD BUDDYS" WHO WOULD SHARE THERE INFORMATION WITH ANYONE??

WHY MUST PROFIT COME FIRST WHEN WE SHARE A RECREATIONAL INTEREST?

JUST LIKE A DRUG ADDICT IN RECOVERY WHO KNOWS NOTHING ELSE BUT ADDICTION AND MUST THEN TRY TO PROFIT ON HIS/HER KNOWLEDGE AS THEY TRY TO HELP THOSE STILL SUFFERING. THE OLD GOOD BUDDYS HAVE SOLD OUT BY TRYING TO PROFIT ON THEIR KNOWLEGE WHICH WAS ONCE NOTHING MORE THAN A COLLECTION OF GOOD WILL COMMUNITY KNOWLEDGE.

THE ALMIGHTY DOLLAR IS WHAT HAPPENED TO THE CB DAYS OF OLD. NO LONGER CAN YOU FIND A GOOD BUDDY WITH FREELY GIVEN BY GOOD WILL ANY AND ALL INFORMATION THEY HAVE. IT IS CALLED SHARING. AS PROFIT CORRUPTS OUR CITIZEN'S BAND WHICH IS NOW FULL OF SELF ANNOINTED "PROFESSIONALS" WHO, FOR AN UNJUST FEE, WILL SELL WHAT WAS SO FREELY GIVEN TO THEM WHEN THEY WERE THE NEW JACKS ON THE BAND.

A "PROFESSIONAL CITIZEN BAND OPERATOR." HAS CITIZENSHIP BECOME SUBJECT TO SALE? I HAVE NO OBJECTION FOR CITIZEN BAND OPERATORS CHARGING A FEE FOR SERVICE (RADIO REPAIR, SALES ETC.). BUT TO SELL INFORMATION THAT WAS ONCE FREELY GIVEN SEEMS OBSCENE TO ME. THAT IS WHY I AM NOW AS HAM RADIO OPERATROR WHERE YOU CAN STILL FIND A GOOD BUDDY WHO WILL PROVIDE INFORMATION (COPIES OF SCHEMATICS) WITHOUT A FEE.

22. info: SSB legal in Germany now

Newsgroup: rec.radio.cb
Date: 2002-06-01 09:44:29 UTC
From: Henning Gajek <hrgajek@t-online.de>
Message-ID: <ada54r$gk5$06$2@news.t-online.com>
Source record: 125928

Hello CBers

for your information:

Single Side Band (SSB) Operation is legal in Germany since
May 29, 2002. (See Bulletin of RegTP, from May 29, 2002,
Mitteilung 268/2002 Page 812)

Conditions:

SSB-Channels/Frequencies CEPT 4..15 only (27005 ... 27135 kHz)

It's a time limited test operation (until March, 31, 2004)

Output maximum 4 Watts P.E.P.

Radios must comply ETS 300433 (see www.etsi.org for details)
There are not many radios in the market who fullfill this yet.

Users of SSB need a special license which can obtained from the local
RegTP Office (see http://www.regtp.de)

Foreign (european) Users coming to Germany may use their sets, if it
complies EN 300433 and is type approved / legal in their home county.
They must carry the Circulation Card issued by their home country.

Other regulations for Germany

80 Channels (26565...27405 khz) FM only 4 Watt max
40 Channels (26965...27405 kHz) FM only ("CEPT") 4 Watt max
12 Channels (27005...27135 kHz) AM 1 Watt Carrier 4 Watts P.E.P.
12 Channels (27005...27135 kHz) SSB 4 Watts P.E.P.

Cost of CB-License (unlimited number of radios) 15 EUR / year.

NIce offer........Poor use of English!
Free does not take
'for" as in "for free".
You would provide these "free".
I do like how you correctly used "who" rather than "that".

As I have posted my comments on them in this forum in the past I think I should keep it that way. I got this in the mail from them the other day:

Subj: Whats your
Date: 5/30/02 4:54:04 AM Eastern Daylight Time
From: BigJohnsonRadios
To: TRA1N

Whats your Problem we did nothing to you why are you slamming us. 667 has nothing to do with No Name if he is your problem

My problem with No Name is as follows:

1) After calling them to get pricing on amps I was told they offer little (10%) discount to dealers off list.
2) I was "confronted" on PalTalk by the guy I talked to a few days later asking me this very same question who then started going on about what I heard isn't exactly what he had said. He then went on to tell me the very same thing again.......IDIOT!
3) They are stupid enough to think I would slam them just because of the discontent caused to 667 other than that it is a good measure of how they treat people who support the products the make.

29. FS: Four Heathkit GW-21 Citizen Band Walkie-Talkie Transceivers

Newsgroup: rec.radio.cb
Date: 2002-06-01 16:10:13 UTC
From: mnowlen@comcast.net
Message-ID: <3cf8f315.478491294@news.va.comcast.giganews.com>
Source record: 125935
Cross-posted to: rec.radio.cb,rec.radio.swap

See Pictures:
http://mywebpages.comcast.net/mnowlen/heath-gw-21-front.jpg
http://mywebpages.comcast.net/mnowlen/heath-gw-21-top.jpg

Four Heathkit GW-21 CB Walkie-Talkies from the 1960s. I had a similar set as a kid. I got these with the intention of restoring them but just don't have the time. Two look to be complete and fairly clean with all controls and whip antennas. The other 2 can be used for replacement or spare parts. Two sets of snap-on leather straps included. Someone with the time and ability should be able to make a good pair. Sold as-is.

$35 for all four
Plus actual shipping charges
Send Zip code for shipping costs

Please email if interested,

Mike

JJ is one of the idiots that took the wars from 75 meters to Usenet to
avoid being Rileyed. He insists on cluttering rec.radio.amateur.misc with
the doodoo from flamefest as if we were supposed to care. Kind of Randy
on a bigger scale but equally fart-offable.

Ron, In a May 13 Public Notice, the FCC points out that it's a
violation of FCC regulations to import or market a transmitter
designed or intended to operate outside the amateur bands unless the
equipment has been issued a grant of equipment authorization for the
radio services it's capable of operating. The FCC says it wanted to
clarify its rules on equipment that's "intended to operate in various
radio services in the high frequency radio spectrum, including
'10-meter' Amateur Radio Service (ARS) equipment." The
notice--directed to "manufacturers, importers, vendors and users of
these transceivers"--emphasizes that transmitters intended for use by
FCC-authorized radio services except the Amateur Radio Service must be
type-accepted.

Train's latest blunder, for your enjoyment.

Here he is, advertising "10 meter amps" on his site:

>10 Meter Amps
>
>DAVE MADE*
>X-FORCE*
>AUDIO BY COOKIE*
>TEXAS STAR*
>PALOMAR*
>COBRA*
>Miscellaneous Amps*

OK, so if...

FCC rule 2.815(b): After APR 27, 1978, no person shall manufacture, sell or lease, offer for sale or lease (including advertising for sale or lease), or import, ship, or distribute for the purpose of selling or leasing or offering for sale or lease, any external radio frequency amplifier or amplifier kit capable of operation on any frequency or frequencies between 24 and 35 MHz.

Then...

>10 Meter Amps

...are illegal!

This doofus can't even put together a phoney disclaimer that is HALFWAY convincing.

personally, I dont run amps. I tune all my radios for swing and that does me just fine.....BUT.....there are alot of people that run amps. If the Friendly Candy Company cared so much about freebanders using amps to get out further, they would start shutting those people down. I dont see many people being hit by the FCC for running "power". If you dont like amps Aaron, then dont buy one. Seems simple enough. In my state, it is legal to own one just not run it. I own two of them, I dont use them, but I still own them...I'm not breaking any laws. Any body want to buy a palamar 225? email me if so. LOL

Sure and I have for sale a bridge in Brooklyn.

>I'm not breaking any laws.

And I'm not breaking any laws by stopping eBay auctions, posting CB rules, expressing my opinion in this NG, or notifying the FCC of people who sell CB amps in violation of FCC rules.

>Any body want to buy a palamar 225? email me if so. LOL

Want to see the FCC rules again? LOL

I am not sure on what you need

I do like the amp, But a standard CB either AM or AM,SSB will be over driving the amp to get the best out. How can anyone put in a standard 4 Watt AM siginal to this amp with its 16 Watt p-p of power, come out with 140 watts with 185watts p-p sound, Low modulation. This is probley why some people cut the limiters, drive the audio way up to cause clipping, and then drive this through a amp. Its no longer a good siginal but a form of digital modulation either on or off. 10-12 db gain is all that is needed , not pushing the amp where no signal will sound good. ,Use the amp like it should be used, do not overdrive it.
To me a amp should amplifie without going into compression.From your power in verses power curve, this amp will put out 40 watts with 1.25 watts in and 160 watts out with 5 watts in a 1:4 ratio just right for AM.1 This is why I will drive my amp with about 1.25 Watts carrier AM modulated from my radio.
For as the amp it looks like it is well built.

You are certainly correct that if you enter the "compression" area that sound quality (not volume) will decrease. there is also another bad side effect... your harmonic content will increase dramatically because you have entered a non-linear area. The secret is always not to get too greedy...

Source record: 125984

Careful on this one. Diesel Electronics sells a good looking little device called the Quad Star. (You can find them at TA and Pilot...) It's four small ground stubs connected to a large hex nut which your vertical is mounted upon.

The idea is to turn your mobile into a mini ground plane. In fact, the instructions on the back of the package state that the device is "designed to improve the radiating ground on all fiberglass antenna..."

Problem is, if you pay attention to the instructions, it doesn't connect to the ground side of the antenna...but is in line with the antenna itself. You're suppose to remove the hex nut that the antenna screws in and replace that with this Quad Star hex nut...over the nylon washer that separates the grounded mount from the center radiating antenna. This would mean its connected to the antenna...NOT the ground.

But if you try to remove the washer and connected the unit to ground, you can't screw the antenna back in without grounding it out!

I love the idea! And it can work! But they've got to re-make that center hex nut so that it will attach to ground...AND...allows it to connect to the center lead of the coax.

79. Check this out! For Aaron

It's a joke that does not/can't work, and is designed to look impressive. If
you want to learn more about how it works, look up the word "placebo" in the
dictionary. <g>

Thanks, but something "akin" is not the thing itself, but only
something related to it. So you need to specify what it is, Randy.
See? When the sum total of your education consists of reading the
National Enquirer while you're standing in line for a six pack at the
local U-Totem there's going to be embarrasing moments like this.

For a radio WITHOUT SSB, you are about 75 bucks too high. I have yet to understand why Galaxy made so many AM/FM radios without SSB or why they commanded such a high tarrif on these models. You would be very hard pressed to find somebody willing to pay 200 bucks for a NON SSB radio in used condition. With used FULL feature Galaxy and RCI radios out there going from 150 to 225 used, you might want to adjust your asking price accordingly if you a actually interested in selling this unit.

>your provider. I hope this will not be necessary...

Let's see now: They aren't breaking Usenet policy (which isn't even
law); their posts aren't any more harassing than thousands of other
posts in thousands of other newsgroups; you haven't been threatened
with violence; nobody has disclosed personal information about you
that you haven't disclosed yourself; etc. So, it seems to me that if
you start trying to get people TOSsed from their ISP's just for
discouraging illegal behavior then it will be YOU causing the
harassment. But that wouldn't be a very smart thing when you do it
while thumbing your nose at the FCC. I'm sure you will go right ahead
and violate all the federal regulations you want, but don't be a
hypocrite and expect others to faithfully abide by newsgroup
guidelines just because you have thin skin. And don't expect
concerned, law-abiding citizens to sit idly by while you repeatedly
commit a federal offense by spamming the newsgroup with your illegal
junk!

Maybe you are starting to see that you really don't have anyone to
complain to but yourself. However, if you really want to push the
issue, go ahead and try and present a legal harassment case against
anyone that opposes your criminal activities in this newsgroup. But
make sure to let me know when and where because I wan't to be there to
see you get laughed right out of court and then hauled right back into
federal court to pay your FCC penalties! No, Brian, it is YOU need to
take a step back and take a real objective look at your activities and
how they relate to your legal and financial future!

Now then, are you starting to see the "big picture" here?

Why? I already offered to make a public apology to Randy if he could
explain his BS.

And FYI, I said you can "detect standing waves" on twin lead with a DC
voltmeter, not "measure SWR". And you can. You just refused to try it.

120. Local pawn shops: a great source of illegal CB equipment

Newsgroup: rec.radio.cb
Date: 2002-06-02 19:14:36 UTC
From: toomanyradios@aol.com
Message-ID: <20020602151436.09649.00001080@mb-ch.aol.com>
Source record: 126021

Recently, I've begun frequenting pawn shops in search of bargains. If you know what you're doing, one can often find quality small electronics items at far below the "new" prices.

I'm frankly amazed at the amount of illegal CB equipment that is sold openly at these pawn shops. In just the last few months, I've seen several Uniden HR-2510s and Ranger/RCI "10-meter" radios. All had been modified for 26-30Mhz coverage. Also several models of Galaxy "export" radios and a good selection of small-to-medium sized linear amplifiers. Guess the FCC missed the hock shops in their recent "crackdown" on banned equipment sales.

I'm surprised Aaron and the other anti-illegal equipment crusaders haven't taken up this cause as of yet.

> He's just trying to wriggle out on a technicallity...

Speaking of wriggling out of technicalities, how are you getting by
the fact that the sale and marketing of external RF amplifiers
covering 11 meters is illegal?

You know that Riley Hollingsworth of the FCC is unpredictable in which
violators he goes after first. It's not always the biggest. In fact,
take a look at what he did to this guy's little home-based business
(below).

Who knows. You could be next?

-Aaron-

FCC Enforcement Case Highlights FCC Amplifier Certification Rules

NEWINGTON, CT, Oct 2, 2001--The FCC's Riley Hollingsworth used the
occasion
of a recent Warning Notice to hammer home the FCC's position on the
sale of
RF amplifiers that have not received FCC certification--formerly
called
"type acceptance." In a September 19 letter to Extra licensee Sidney
Lee
Martin, KD4YBC, Hollingsworth reiterated an earlier FCC warning to
Martin
that he cease commercial marketing of non-certificated external RF
amplifiers and amplifier kits capable of operating below 144 MHz.
In 1978, the FCC banned the manufacture and sale of any external RF
amplifier or amplifier kit capable of operating below 144 MHz without
a
grant of certification from the FCC. The rules specifically prohibit
manufacture and sale of amps that operate between 24 and 35 MHz as a
means
to stem the flow of illegal Citizens Band amplifiers.

The case arose from a February 11, 2000, warning to Martin from the
FCC's
Detroit office as a result of a classified ad Martin had run in QST.
The ad

featured the sale of external Amateur Radio RF amplifier kits for HF and 6
meters. The FCC letter admonished Martin that selling or offering such units
for sale violated ï¿½2.815 of the FCC's rules.

Martin--who operated a one-man business called RF Electronics in South
Carolina--countered with his interpretation that he was allowed, under FCC
Part 97 Amateur Service rules, to sell such kits as one amateur to another
under an exception to the certification rules. Martin argued that ï¿½97.315 of
the Amateur Service rules permitted his licensed customers to purchase from
him--as another licensee--and construct or modify one model of a
non-certificated RF power amp or kit per calendar year for that licensee's
personal use.

The FCC rejected that analysis, however. Hollingsworth emphasized that
ï¿½2.815(c) of the FCC's rules requires all external RF power amplifier kits
that can operate below 144 MHz after assembly be FCC-certificated before
they can be made, sold, leased, marketed, imported, shipped or distributed.
He noted that other provisions of ï¿½2.815 apply only to certain already
fabricated amplifiers and do not exempt amplifier kits, particularly those
capable of operating between 24 and 35 MHz after assembly.

Hollingsworth said ï¿½97.315 also "specifically prohibits the use in the
Amateur Service of an amplifier that the operator had constructed from a
non-certified kit." He also noted that, in addition to kits, Martin's RF
Electronics Web site had been selling non-certificated, assembled RF power
amplifiers for use below 144 MHz. Hollingsworth said at least three of the
assembled models were advertised as operational between 24 and 35 MHz.
Hollingsworth said FCC rules permit an individual amateur to construct or
modify a non-certificated RF power amplifier once per calendar year for use
at that amateur's own station--although the unit may not be built from a
kit--and the amateur may then sell the amplifier to another licensee or
dealer. The rules do not provide for mass marketing or manufacturing

and
marketing kits or assembled amplifiers as part of a business,
Hollingsworth
said.

"Any and all marketing of external RF power amplifiers or amplifier
kits
capable of operation below 144 MHz must be in strict compliance with
ï¿½2.815
of the Commission's rules," Hollingsworth warned. He said the FCC
would
prosecute any violations and take enforcement action against Martin's
amateur license.

Martin's Web site no longer offers any RF amplifiers for sale.

Thanks Much Dave! :)
I appreciate the feedback. I'll try replacing the final and check the rest
of the circuit to see if the components are fried or not with my multimeter.
I've got the Washington Service Manual on order, so hopefully I can get all
the extra information I need. It's nice to know that it should be an easy
fix though. Thanks again.

Yeah, this was one of the first things I checked, since it's one of the documented adjustments that I could find online. That was my thought also, that whomever owned it previously was using it with a linear, but dropping the VR to the minimum position only raised the output maybe 1/4 watt or so, just barely enough to move the meter a bit more toward '1'.
Luckily it looks like it'll be a cheap fix, since the transistors and other components I need will only be a few bucks.
Thanks for the feedback.
Pyro.

RULE 11 - Linear Amplifiers

{A} You may not attach the following items (power amplifiers) to your type-accepted CB transmitter in any way:
[1] External radio frequency [RF] power amplifiers, also called linear amplifiers, or linears;
or
[2] Any other devices which, when used with a radio transmitter as a signal source, are capable of amplifying the signal.
{B} There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.
{C} The FCC will presume you have used a linear or other external [RF] power amplifier if-
[1] It is in your possession or on your premises; and
[2] There is OTHER EVIDENCE that you have operated your CB station with more power than allowed by CB Rule 10.

It's a HAM radio, Joe. And it's not a FAKE ham radio like the Galaxy's or RCI's. This ham radio is meant to be used by licensed amateurs only.

Brian Griffy (Professor) says that everyone in the NG knows the FCC rules for CB. Apparently he is dead wrong. Guess you don't know the rules, Joe, or else you wouldn't be asking about running a ham rig on CB.

Anyhow, here is the pertinent paragraph from the FCC rules for CB.

RULE 9 - Equipment

{A} You must use an FCC type accepted CB transmitter at your CB station. You can identify an FCC type accepted transmitter by the 'type acceptance' label placed on it by the manufacturer. You may examine a list of type-accepted equipment at any FCC Field Office or at FCC Headquarters. Use of a transmitter which is not FCC type-accepted voids your authority to operate the station.

General Coverage Mod for YAESU FT-747GX -- 1) Remove top cover. 2) On backside of display unit, there is a brown jumper wire near the large ribbon cable. 3) Cut the brown jumper wire. 4) Turn the radio on and set the frequency to 12,345.6 KHz, then turn the radio off, then on again. 5) This enables the general coverage mode and a GEN display will come on and stay on at the top of the LCD display. 6) Reassemble the unit. It will now transmit everywhere it receives, however, Yaesu recommmends that it only transmit between 1.8 - 30 MHz. Disclaimer: I'm passing this on from someone who owns one of these and has done the mod. I have not done or tested this mod. You do it at your own risk.

RTC has been reset -- I set it wrong when I changed the battery.
Thanks, Mike.

By golly, I did say that! Doesn't really matter because it's true, you
-can- measure SWR with a DC voltmeter.

>Looks like you said "measure" to me. You also quickly removed the claim

The page is still there, I just never got around to linking it from
the main page. I have a few more pages that I forgot to link up when I
revised my index.htm. Again, your point?

Actually, no you don't. SWR is the ratio of Vmax to Vmin on the
standing wave. The wave doesn't move (standing?) and can be measured
as a DC potential. It's easier to measure on twin-lead since you don't
have to poke through the shield, but you can indeed measure SWR with a
DC voltmeter.

Looks like you said "measure" to me. You also quickly removed the claim
that you can "measure" SWR with a DC voltmeter from your web page after the
guys on r.r.a.a set you straight.

BTW, if you want a laugh, ask any of those dopes in rraa how to make a
6:1 balun -- you will get a few responses making every excuse in the
world why NOT to make one, a few people telling you the difference is
insignificant, a few more will shift the topic to continue some old
argument (much like you are doing with this thread), and a few others
will argue with the others for the sake of arguing. In the end, you
will never get an answer because none of them knows shit -- you
included.

No PLL, but I do have a CATEL FMX-2100 FM modulator, should match up
well with your amp. Xtal freq set for 105.3 MHz.

My goodness but you have a hair up your ass today. And I still have
that Catel modulator, and the manual is online. I also have several

other pieces of used broadcast equipment. Interested?

Explain how it is possible to "measure" SWR with a DC voltmeter.

This is getting boring, Phil. I already answered your question, and if
you want a practical procedure then go sift through the archives again
because I provided that in a previous post as well. Now go find
something better to do with your time instead of obsessing about me.

Frank Aaron why are you trying to avoid answering the question. Show us
that you are not "selectively illiterate" by explaining how it is possible
to "measure" SWR with a DC voltmeter.

Funny how you immediately label anyone who disagrees with you a "dope".
Actually, Frank Aaron, you are just sore from the butt spanking that you got
in r.r.a.a. You came into the group trying to look like an "expert" and you
were shown your ignorance on many subjects. There are many people on
r.r.a.a that have much more education and experience than you so now you
hide out on rec.radio.cb where you are with your intellectual equals. It is
a good place for you.

You have not answered the question. Explain how it is possible to measure SWR with a DC voltmeter. You offered no explanation in r.r.a.a. You can show off that great intellect of yours here in rec.radio.cb by telling us how it is possible to measure SWR with a DC voltmeter.

>Funny how you immediately label anyone who disagrees with you a "dope".

It's not funny at all because I don't. I respect other people's
opinions, but when people refuse to accept what I know to be factual
then they are dopes until I'm proven wrong. And I have been proven

wrong many times on Usenet. But not about this.

>Actually, Frank Aaron,

Inability to accept reality is the benchmark of obsession. I'm not Aaron, and you should be able to tell after reading all my previous posts. Of course if you would rather ignore the facts, that's a choice you should probably make with the consent of your therapist.

> you are just sore from the butt spanking that you got
>in r.r.a.a.

HAHAHAHAHAHA!!!!! HARDLY!!! It's the absolute truth! Just look it up in the archives -- try the keyword "6:1 balun" and read the responses. It's a riot!

> You came into the group trying to look like an "expert" and you
>were shown your ignorance on many subjects. There are many people on
>r.r.a.a that have much more education and experience than you

I formed my opinion about rraa long before I ever posted on Usenet. That's why I never posted there.

> so now you
>hide out on rec.radio.cb where you are with your intellectual equals. It is
>a good place for you.

If you are suggesting that my education and experience are somehow less than adequate for anything more than CB radio, I should first point out that you are posting in this newsgroup yourself, and that doesn't say much based on your own argument. But maybe you should dig up some of my posts on sci.physics or sci.physics.electromagnetics. You might be able to find a mistake I made in one of those posts. I'm suprised you haven't mentioned them already....or was there a reason you haven't mentioned my activity on those forums?

The hell I didn't! If you want me to reword the answer so -you- can
understand it then post a link to an English-to-Idiot translation
engine.

I'm not here to show off anything. However, it seems you are here
because my posts are stuck in your intestinal tract. Try some ex-lax.

You betcha! I'll even build you a nice little antenna that you can
hide in your attic, or maybe a folded dipole tuned to the modulator
freq. Heck, I'll even peak the power and widen the ratio just so the
FCC can find you faster!

Maybe you are the "dope" because what you believe to be factual is actually
fiction. Like measuring SWR with a DC voltmeter.

> >Actually, Frank Aaron,

Ok, Frank Aaron (rhymes with Hank Aaron) you can deny it but it doesn't make
it so.

No, I am talking about the butt spanking you got over some of the material
on your SWR web page.

Maybe your education and experience are not even adequate for CB radio.

>, I should first

I never said that I am an expert on measuring SWR with DC voltmeters like
you are.
I am just a stupid cber.

>But maybe you should dig

An ignored response or two to someone else's post isn't worth mentioning.
Next you'll be telling all of us cbers how much education you have.

Also, posting to the UFO groups wasn't worth mentioning either.

BTW, how do you measure SWR with a DC voltmeter?

So you remember explaining how you can measure SWR with a DC voltmeter like
you remember saying that you can "detect standing waves" instead of
"measure". We now know that you actually did say "measure" so I suspect
that you did not explain your DC voltmeter - SWR theory.

> If you want me to reword the answer so -you- can

Ok, now you have lowered yourself to name-calling. I should have expected
it from you. Yes, rec.radio.cb is a good place for you.

Have it your way, Frank Aaron, I am an ignorant cber. Please explain to me
how you can measure SWR with a DC voltmeter.

Like you are stuck on Randy's one-way two-way skip problem. You have asked
him repeatedly to explain it. You seem to think that it is OK. I am
asking you to explain how you can measure SWR with a DC voltmeter.

I've explained it to him, but not in the fashion that he's twisted the words
to read.

Oh well. Back to searching for Sasquatch.

>
>Wrong again Frank Aaron. You did post in r.r.a.a.

Duh! Is that supposed to be some sort of profound observation? After all, we were talking about my posts in rraa, right? I ended up posting there for that one topic only because someone posted the page on that forum. I don't post there otherwise, but I guess you are just nitpicking, right? Ok, pick away. At the same time, did you see the positive responses in that forum? The ones that were in agreement? I guess you didn't look that hard, huh? Selective literacy...

>> > so now you

>> suprised you haven't mentioned them already....or was there a reason
>> you haven't mentioned my activity on those forums?
>
>An ignored response or two to someone else's post isn't worth mentioning.

Obviously you didn't bother to look very far. I noticed that a lot of my posts in those forums demonstrate a common theme: I enjoy debunking technical (and scientific) bullshit. Here are the threads of a few of my favorites:

"Direction of induced current?"
"The substance of Gravity? Now we can find it out ... "
"Proof that E&M theory is wrong!"

"Feynman's EM error?"

And here is one where I was proved wrong:

"Boiling water, the strangest thing happened"

But my favorite by far is where some idiot tried to tell me that the valence of copper is "three or four" by trying to confuse valence with oxidation states:

"Velocity of electrons?"

An ignored response or two? Try again, Phil.

>Next you'll be telling all of us cbers how much education you have.

You forget that I'm a CBer, too. And I really don't care how much education or experience someone has or doesn't have, if they don't have enough common sense to look up a definition, or to make simple logical conclusions, or to just verify the facts when the facts are readily available, then they are idiots. And I include myself in that category whenever appropriate.

>Also, posting to the UFO groups wasn't worth mentioning either.

I agree, as well as the mad scientist forum.

>BTW, how do you measure SWR with a DC voltmeter?

Ok, you have made enough of an ass of yourself for one night:

Locate the point across the twinlead with either the greatest or least DC potential. Measure it. Move the probes one-quarter wave up or down the transmission line. Measure it. Do the math.

There. Now pester Randy to explain his technical ignorance. Maybe you can learn something from him, too.

Like Frank Aaron tried to twist his own works to say "detect standing waves"
instead of "measure" with a DC voltmeter. He is still smarting over the
butt spanking he got in r.r.a.a

> Oh well. Back to searching for Sasquatch.

Good luck!

Boy, this sure sounds like a "troll" to me, but what the heck, I'll bite. Thanks for the suggestion, but I don't think I'll go visit any pawn shops soon. However it's certainly within my rights to post here in rrcb, especially when I see folks trafficking in contraband equipment.

In any case, welcome to UseNet. You have two choices. (1) Ignore my posts and go about your criminal business. (2) Keep posting misinformed and ignorant excuses to break the law, which I will handily refute.

-Aaron-

173. Conversion- 6LQ6 to 4CX250

Newsgroup: rec.radio.cb

Hello ! I have a D&A Phantom Dual Power ten tube, 10 meter base amp with all bad tubes (they all test to about 30%). Has anyone out there ever heard of converting one over to 4CX250B's. Today true transmitting tubes are far cheaper than fragile TV horizontal output tubes. Since I have 40 or 50 4CX--- series tubes lying around and am an experienced ham home brewer I think it might be a worthwhile project and challenge. However, not wanting to unnecessarily re-invent the wheel I thought I might get some useful information from anyone on various newsgroups who has done it before. Thanks for any tips.

What did you explain, Randy? In response to a post regarding noise caused by skip you "proclaimed" that noise changes because "skip is not reciprocal", but you never "explained" why. You see, such a statement requires some sort of elaboration, because even the most casual observer can see that the lack of reciprocity of skip is not going to have any effect on noise. So maybe if you were to explain your statement a little better I, as well as others, might agree with you. Do you have knowledge of some sort of some imperceptible phenomenon that is previously unknown, and that could explain your obvious discrepancy with the facts? By all means share that knowledge! Otherwise, you are proving yourself over and over to be just another big-mouthed idiot.

Those amps are illegal for use on CB radio. Try your question on a ham
group where the topic is appropriate.

A DC voltmeter doesn't measure RF very well without a RF probe.

Why do you have a DC potential on your twinlead? What does a DC potential on your transmission line have to do with SWR? Are you claiming that the supposed DC potential on your transmission line is related to the SWR on the line? I know that I am a dumb cber but I though that RF was alternating current.

Now you are showing your technical ignorance, Frank Aaron.

You uttered some nonsense about measuring a DC potential on a transmission line. Why does your transmission line have a DC potential on it? Bad blocking cap? LOL

If you are trying to tell me that "standing waves" represent a DC potential on a transmission line then you are what you called me - an idiot.

You know, I suspect that he knows that he is wrong and that
he purposely gives mis-information so that he will get an argument.

Strange how it all has nothing to do with his claimed "legal quest". Why
is he devoting so much time to trying to prove he knows more about
me than I do, when it serves no "Anti Keyclown" or "pro-legal" purpose.

It's obvious that his interest is not in the "pro-legal" issue as he claims,
but simply in filling the newsgroup with arguments and hatred.
He has even turned his anger and hatred on:
Legal CBers,
Pro-legal people,
Radio Amateurs,
CBers outside America.
Anyone from Birmingham, UK.
None of which has anything to do with a "pro-legal" CB battle.

Regards,

Brainbuster.

Hi, Aagent Aaron.

So, by your logic...
If you said the earth was flat and I replied that it wasn't, that would
make your suggestion correct and all the globes in the world would
be false information.

Voobie Logic.

You want me to lie so that your *dreams* would seem more real... huh?
If I lied and said that I was... would you say that proves I was not?
Hahahahahaha... yeah right.

Aadmit it, Aagent Aaron... you hear those voices in your head and just
have to follow their guidance, regardless of how stupid it may seem.
Those little voices in your head cannot be wrong... can
they, Aagent Aaron?

===
> > You really need to get help with distinguishing between real life and
> > your dreams about being a secret agent.
>
> Secret agent? Have you been rooting thrugh mum's musty stack of Ian
> Fleming paperbacks again?

> > old table cloth to give it a pretty lace effect on the edges for you?
>
> No but she howls with laughter when I tell her how desperate you are
> to prove you have nothing to do with Birmingham.
===

Ah, but you - Agent Aaron - are desperately trying to convince
everyone that the voices you hear in your head are not lying... that Aagent
Aaron is a mystic with the powers to find someones birth place just
by listening for the voices in his head.

Maybe part of you realises that those little voices in your head cannot
be trusted... they tell you lies.

Beware of the voices, Aagent Aaron.

So, what colour is your cape, Aagent Aaron... don't ask the voices
in your head, take a look for yourself.

===
> I've never met anyone who exhibits such an aversion to people from
> Birmingham. Where did this phobia come from?
===

Eh... you first mentioned the place... you launched into a mad attack on
"brummies", their food preferences, their life style and their work, Aagent
Aaron.
But those voices in your head keep quiet about those facts... don't
they, Aagent Aaron.

Look in the mirror... the man you seek, with the "aversion
to people from Birmingham" will appear before you as if by
magic, Aagent Aaron.

Take another look at how you view Brummies, Aagent Aaron...

Great job of explaining why, rather than the "beat them into submission"
method used by some others on here.

There's just one thing you seem to have missed out...
How does he get audio like the broadcast stations (or the TV adverts that are
always louder than the programs), without sounding like s**t warmed up.

What was that you muttered... a decent Speech Processor?
I'll go along with that, what does one cost on that side of the pond?

If the person has access to the correct equipment such as a 'scope and knows
how to use it, then he could also set it up at the optimum modulation level.
I once had a CBer tell me he had purchased a 'scope, he then asked if I could
show him how to use it. The problem was that he had NO electronics
knowledge and did not even know what the thing was for (just that everyone
else
seemed to have one, so he should), so he would need to be taught about basic
electronics, waveforms, distortion, recognition, diagnosing from waveforms,
etc.

Regards,

Brainbuster.

Actually, Aagent Aaron, he is whining that he has to pay for some things.
His problem is not with the legality, it is about having to pay his own
way in life.

===
> Are you a retard?
===

No, he's a freeloader (not to be confused with "freebander").

===
> You expect petty criminals to be "honorable"?
==

There you have it lads, being a "Keyclown" is just a "petty" offence...
rather like doing 45 in a 40 limit.

Let's take it one step further...

The "Anti" mob say:
Freebanders "steal" frequencies.

And, it is said that:
There's honor among thieves.

Therefore:
Yes Aagent Aaron, we can expect illegal CBers to be "honorable".

Brainbuster.

Assuming that this was your real view, not just another Amateur "full of himself" (has his head up his ass) trolling this group... replies below comments:

Ka2tus <ka2tus@aol.com> wrote in message news:20020601000209.03137.00002409@mb-da.aol.com...
>
> WHAT EVER HAPPENED TO "GOOD BUDDYS" WHO WOULD SHARE
> THERE INFORMATION WITH ANYONE??
===

There is plenty of free information on the Internet, and on so many newsgroups. You will find schematics, mod info, wiring diagrams + much more, free on the Internet.

Have you tried looking?

===
> WHY MUST PROFIT COME FIRST WHEN WE SHARE A RECREATIONAL INTEREST?
===

We all need money to survive.
Why should someone put a "good buddy" and his hobby before the ability to feed his family?

I am always willing to help where I can, but if it comes to a choice of supporting someone with their hobby or supporting my children by putting food on the table so that they can eat... well, guess which one wins.

It is always nice to get something without having to pay directly at the time or at the expense of the paying customer, but the world cannot run totally that way.
I do not know about America but, in the UK, it is becoming harder to live on the "average" wage so people need to survive by making money where they can.

===
> JUST LIKE A DRUG ADDICT IN RECOVERY WHO KNOWS NOTHING ELSE BUT

> WHEN THEY WERE THE NEW JACKS ON THE BAND.
===

Tell us, do you work for an employer just for "goodwill" or do you expect to
be paid for helping him out? Can you only be paid for doing work that you
hate?

Not all Professionals are "self appointed"... many have certificates or
licences which were given by accepted authorities or institutions.
Or are you of the opinion that CBers are all too stupid to have certificates
and be REAL professionals?

===
> I HAVE NO OBJECTION FOR CITIZEN BAND OPERATORS CHARGING A FEE
> FOR SERVICE (RADIO REPAIR, SALES ETC.).
===

Very nice of you to let us do that... thank you, Sir.

Providing information is a service, unless the info is about a product
that you hope to sell or have sold to the enquirer, then it becomes
marketing or customer care.
A service is any intangible product.

===
> BUT TO SELL INFORMATION THAT WAS
> ONCE FREELY GIVEN SEEMS OBSCENE TO ME.
===

OK, answer this one for me...

I sell service manuals for radios, usually ones that are not available
elsewhere. To study the equipment, work out the procedures, draw
the diagrams from scratch by looking at the circuit, type out the text,
proof read, correct errors, etc takes some time... to say the least.

Do you approve of me charging for copies of these manuals or the
component databooks I also offer for sale?

===
> THAT IS WHY I AM NOW AS HAM
> RADIO OPERATROR
===

Boy, are you in for a short, sharp shock!
Have you seen:

1. The prices of Ham gear in the shops?
2. The sale of wire antennas which could be made cheaply?
3. The price of those wire antennas?
4. The sale of ready made patch leads to Amateurs?
5. The price they can get for these ready made leads?

Compare the prices of Amateur equipment to that of CB, then consider that much of the Amateur equipment could be made easily and cheaply.
Also consider that Ham radio was about building your own equipment but now they just go to the shop, hand over lots of dosh, then plug and play. If it goes wrong... the shop will fix it.

Now then... who has sold out for the "almighty Dollar" (or the "powerful pound" here)?

===
> WHERE YOU CAN STILL FIND A GOOD BUDDY WHO WILL
> PROVIDE INFORMATION (COPIES OF SCHEMATICS) WITHOUT A FEE.
===

Yeah sure, like all Amateurs do it for the "goodwill". Should I go to the local Ham shop and ask if I can have a free schematic?
When was the last time you tried depositing $200 of "goodwill" into your bank account? How about your local Supermarket, will they accept "goodwill" in exchange for goods?

This "anti-spending" attitude made CB in the UK pretty dismal at one time. Because UK CBers were not willing to spend money on decent radios, manufacturers like Uniden pulled out of the UK market and we got all the crap designs. Some got "bleedover" from legal 4 Watt stations over 4 miles away. You could put one of those radios on CH20 and hear all 40 at once... you only needed a channel selector when trying to get in on one of the conversations you could hear.
The Radiocommunications Agency (our version of the FCC) had to step in and place minimum spec on the receiver adjacent channel rejection. This spec forced the manufacturers to use better designs with crystal filters as standard.

Either something is spot on, correct, useful and worth paying for... or it is crap. incorrect, useless, and just a waste of time or space - even if it is free.
So, regardless of any charge made (or not), if something is not worth paying for then it is not worth accepting as a gift either.

Regards,

Brainbuster.

Hello Z-Duck:

Great idea!!!!!!

I have a few of the old Maverick 250 amps that I thought one day I would convert to a 1 or 2 4CX250 or 4CX350 type amp.

But the problem is that that the power supply transformers may not have enough poop, or even the proper voltage for the newer tubes.

Even if you remove the power supply transformers, and locate newer transformers on a separate chassie, new Tune & Load capacitors, and the Pi Network Coil will have to be changed.

Ah but what a amp you will have ah, say 4 each 4CX350's in a old D&A Phantom 500. I would have to have my picture taked with the Bird meter pinned on the 2500 watt scale, but 7 copies for my Mother.

I have seen a few conversations of amps replacing the sweep tubes with the 4CX250 / 4CX350 tubes, but I believe its no easy task, you will need to your home work. These conversations are rare to really rear!!

Just once at the TRW swap meet I say a beautiful Palamar Skipper 300, converted to a pair of 4CX250's with a separate power supply, and a trick set of meters. It was sold while I was goocking at it.

If someone has done it I would love all the info on it, photos ect.

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

It would be just as "illegal" to modify a CB to work on 10 meters, or
to use/convert any other "illegal in one service" equipment to use in
ARS. NOT. A Texas Star or a D&A Raider can be used in amateur service.

It is up to the operator to ensure the output in within specs.

Without knowing a lot about tubes, I can point out things like
plate voltage and current, filament voltages and just general
things like cooling would require major adjustments. You would
do better to build from scratch.

You mean like operating illegally in order to shirk the
responsibilities of a license? Or lacking the ambition to learn code?
Or maybe some people spent so much cash on those amps and mods that
they can't spare the few bucks for the ticket?

>===

Ummm, once again, it's left to me to point out the obvious, but Sparky, you did forget about this little problem in your snipped reply?

Now then, answer, or shut the fuck up in this thread!

Why do you have a DC potential on your twinlead? What does a DC potential on your transmission line have to do with SWR? Are you claiming that the supposed DC potential on your transmission line is related to the SWR on the line? I know that I am a dumb cber but I though that RF was alternating current.

Now you are showing your technical ignorance, Frank Aaron.

Any answers, Frank?

Brain, you consider yourself to be at least moderately intelligent, right? I submit that you are not even close. You sit there and complain about Voobner who is just jerking your chain, but he keeps jerking the right chains because you keep responding. That makes you just like him, complete with all the malicious rhetoric. The funny thing is that despite my telling you this tidbit of truth you will continue to have your bouts with Voobner, and you will continue to prove him right! LOL!!!

>Any answers, Frank?

Yes there are answers, but not for you, Randy. You still have a little
explaining to do yourself before I answer any questions for you. If
Phil want's to follow up the question, he can in the other part of the
thread where he asked the same question, to which I responded, but he
did not.

My point exactly. The amp is not illegal, but it is illegal to use on
the Citizen's Band. The topic of this newsgroup is Citizen's Band
radio. Is there something I missed here?

>It is up to the operator to ensure the output in within specs.

That is his responsibility.

>Without knowing a lot about tubes, I can point out things like
>plate voltage and current, filament voltages and just general
>things like cooling would require major adjustments. You would
>do better to build from scratch.

There are more appropriate forums for such a discussion, but not a CB
radio newsgroup because the equipment is illegal to use on the
Citizen's Band. That was the meaning of my reply. Was it somehow
unclear?

203. Why Does Everyone Say I Need 18 Feet of Coax?

Newsgroup: rec.radio.cb
Date: 2002-06-03 05:51:53 UTC
From: Jane Doe <janedoe994@msn.comm>
Message-ID: <ZtDK8.101806$Kp.10441600@bin7.nnrp.aus1.giganews.com>
Source record: 126109

One common deception among CB antenna manufacturers is by them using the standing wave to their advantage. The impedance of CB antennas is typically lower than 50 ohms, which means that the current of the standing wave will be at it's maximum at the point of mismatch. But at one-quarter wavelength away from the antenna, and every half-wavelength thereafter, the current is at it's minimum. At these points a SWR meter will read lower than true value s, making the antenna appear to perform better than it actually does. Now, using the standard 50 ohm coax with a velocity factor of 66%, three-quarters of a wavelength is equivalent to 18 feet. This is the length of coax recommended by so many of the CB antenna manufacturers. Using this length of coax will effectively 'fool' any SWR meter located at the transmitter into thinking that the reflected power is lower than it actually is, to the benefit of the antenna manufacturers.

True. Once the electronics of the transmitter are modified in any way
(except for repair and authorized mods) it can no longer be used on CB
even if it is capable of doing so.

Hi

Well, he knows where Birmingham is... he's just a little lost as to
where I am. He has this intense hatred for "Brummies", and the
voices in his head tell him that I am in Birmingham.

The problem is, that Aagent Aaron has a "buddy" (using polite term) who
sends out their used Jock Straps to people, so they want addresses of
CBers to send them to.

As an idea of how lost he is...
> > CHORUS:
> > Across the web I've been
> > Jock and Swollocks
> > Could be the Brain
> > But with a different name.

Seems he is suggesting that I am the same person as "Swollocks", but
he claims that I am a "vannie" in Birmingham, and as for "B. Swollocks...

From: b_swollocks@hotmail.com (B Swollocks)
NNTP-Posting-Host: 195.171.155.5

Which seems to trace to London, and returns:
host5.derbyshire.gov.uk

Looks like Birmingham has moved... now that is what I call "landslip".
Also looks like "M&S Vannies" get a government Internet connection as
part of their job... not bad.

Another desperate, yet failed attempt to prove the voices in his head are a reliable source of information.

Hahahahahaha... Bonk.

Brainbuster.

Galaxy's 2547 looks pretty interesting.
AM/SSB, a few bells and whistles, and apparently a good talker with clean receive. I think it looks pretty nice too.
Should be able to find one for around $250-300, new.
Linus

> Now then, are you starting to see the "big picture" here?

What Brian might not know is that his ISP TOS contains a clause that might be especially relevant to his activities of late. Let's take a look at it now, shall we?

"CoreComm Web Hosting prohibits the presentation of offensive and/or illegal material such as pornography, profanity, pyramid schemes, or attacks upon particular individuals or organizations. Any CoreComm Web Hosting account in violation of these policies will be terminated without warning."

OK, still following? Good. ï¿½2.815 of the FCC's rules specifically prohibit manufacture and sale of amps that operate between 24 and 35 MHz as a means to stem the flow of illegal Citizens Band amplifiers.

Back to CoreComm's TOS, which prohibits the presentation of "offensive and/or illegal material". Illegal material. Hm. Let's think about that for a moment.

Is offering amps for sale in violation of Federal Law, FCC rules ï¿½2.815 illegal? Yes. Is Brian already violating his TOS? Why....yes! Would I wan't to be there when the concerned, law-abiding citizens at CoreComm find out what Brian is doing? Oh yes indeed.

Hello Z-Duck:

Thanks for the flowers.

If someone had the time and money to modify the phantom 500 to a quad
set of 4CX250's or 4CX350's or even a pair of 4CX800's, that would be
great.

A old time War Horse, with new machinery.

I would probably want to mount a Bird type, Watt Meter in the face of
the amp. Sure it wouldn't be stock, but neither are the old Model Tee's
that are Hot Rodded with a tricked out Aircraft type Instrument panel,
with back lighting, simply Bitchen!!!!!

Got my eye on a 48 Ford Pick up truck, that has been restored with a
Chevy small block and trans, new interior, and its nice.

Jay in the Mojave

He he.... Looks like you've never owned a Browning. That "ping" is
really a momentary acoustical feedback from the receiver. Something that
the position and gain of the mike WILL make a difference on.

Also, on the Mark IV's (40 channels), if you run with the squelch up,
there is no "ping". I don't know if that's also true with the Mark
III's.

Ahh, that is the danger in taking the water tank analogy too far. Maybe you should go take another high school physics course.

Frank Aaron, please explain how the superposition of a forward voltage traveling wave and a reverse traveling reflected wave can give you a DC voltage. The standing wave is still an AC voltage (or current) at the frequency of the forward (and reflected) traveling wave. Explain Frank Aaron.

No, Frank Aaron, after you demonstrated your blatant ignorance of
transmission lines I decided to give you a little time hoping that you
might realize your water tank analogy doesn't hold water. But, now I can
see you really believe that the standing waves represent a DC voltage. No
wonder you were laughed off of r.r.a.a.

Frank Aaron, please explain how the superposition of a forward voltage
traveling wave and a reverse traveling reflected wave can give you a DC
voltage. The standing wave is still an AC voltage (or current) at the
frequency of the forward (and reflected) traveling wave. Explain Frank
Aaron.

> Any answers, Frank?

Randy, Frank Aaron remembers a little demonstration in high school physics of waves in a water tank. He is trying to stretch the results so it fits interacting forward and reflected waves on a transmission line. His mistake is that the standing waves on the transmission line are still alternating waves at the frequency of the source. I would like to see the math that proves you can get a DC voltage (or current) from the superposition of two alternating voltages (or currents).

I actually think that he realized the idoicy of his statement (that you can measure SWR with a DC voltmeter's probes placed across a transmission line) when he was corrected by r.r.a.a. He removed the statement from his web page soon after that. He also tried to tell us that he said he could "detect", not "measure" SWR with a DC voltmeter. Since I showed him that he did say "measure" he is now left to defend the statement.

Frank Aaron, please explain how the superposition of a forward voltage traveling wave and a reverse traveling reflected wave can give you a DC voltage. The standing wave is still an AC voltage (or current) at the frequency of the forward (and reflected) traveling wave. Explain Frank Aaron.

Well, time will tell. While I don't expect kilowatt stations to take over GMRS, there will most likely be a vast increase in the "noise level" on once quiet frequencies.

The whole CB "phenomenon", is mainly made up of a bunch of different people, looking for different things. GMRS lacks the DX potential, so those type of people will not be attracted to GMRS. But people looking to broaden their radio horizons (without having to take the "cursed" ham test) may be attracted to this alternative.

The people who will be attracted to GMRS will be the same people that became interested in FRS, namely those who want clear quiet communications, or who want to yack it up with the locals. The range on FRS is a bit dismal, so the allure of higher power GMRS radios (not all of which are handheld), may be enticing.

Since most legal GMRS users belong to a community repeater system to get the best coverage from their handheld radios, illegal GMRS users, will have to "Go it alone" on simplex. The only alternative to a repeater system, is to run higher power. With UHF, terrain makes a big difference, and high power doesn't always guarantee a huge jump in range, but that won't stop some people from trying. Higher power is a bit more expensive at UHF frequencies, but I wouldn't be surprised to see people running power in the 100 to 300 watt range.

But like I said before, time will tell..

Dave

No, Frank Aaron, after you demonstrated your blatant ignorance of transmission lines I decided to give you a little time hoping that you might realize your water tank analogy doesn't hold water. But, now I can see you really believe that the standing waves represent a DC voltage. No wonder you were laughed off of r.r.a.a.

Frank Aaron, please explain how the superposition of a forward voltage traveling wave and a reverse traveling reflected wave can give you a DC voltage. The standing wave is still an AC voltage (or current) at the frequency of the forward (and reflected) traveling wave. Explain Frank Aaron.

What are you measuring then?

Frank Aaron, please explain how the superposition of a forward voltage traveling wave and a reverse traveling reflected wave can give you a DC voltage. The standing wave is still an AC voltage (or current) at the frequency of the forward (and reflected) traveling wave. Explain Frank Aaron.

>
>
> Any answers, Frank?

Randy, Frank Aaron remembers a little demonstration in high school physics of waves in a water tank. He is trying to stretch the results so it fits interacting forward and reflected waves on a transmission line. His mistake is that the standing waves on the transmission line are still alternating waves at the frequency of the source. I would like to see the math that proves you can get a DC voltage (or current) from the superposition of two alternating voltages (or currents).

I actually think that he realized the idoicy of his statement (that you can measure SWR with a DC voltmeter's probes placed across a transmission line) when he was corrected by r.r.a.a. He removed the statement from his web page soon after that. He also tried to tell us that he said he could "detect", not "measure" SWR with a DC voltmeter. Since I showed him that he did say "measure" he is now left to defend the statement.

Frank Aaron, please explain how the superposition of a forward voltage traveling wave and a reverse traveling reflected wave can give you a DC voltage. The standing wave is still an AC voltage (or current) at the frequency of the forward (and reflected) traveling wave. Explain Frank Aaron.

Z-Duck,
You can do a conversion like that, but it would
mean a complete rebuilt of the amplifier. It would
be much easier/simpler in the long run to just start
from 'scratch' and build an amplifier. I doubt that
there would be many parts that you could use out of
the Phantom anyway, so fill it with concrete and use
it for a boat anchor.

Hi Ron,

No problem with your jumping in here...

Frank Aaron thinks that because a forward traveling RF wave and a reflected reverse traveling Rf wave superimpose to form a standing wave, the standing wave must be DC. And since the standing wave is DC he can directly measure it with a DC voltmeter. I would like to see the math that proves the interaction of two AC waves gives rise (through superposition) to a DC voltage. Maybe he picked up this idea from the new physics over in the UFO newsgroup. The same physics that gives us perpetual motion machines. Since Frank Aaron likes to ridicule others when making factual errors I think it is time to give him a taste of his own medicine.

I post where I damn well please. Sparky seems more interested in picking a fight than promoting legal operation. I was seeking a little info for a CB amp that I use for 10 meters. I am an advanced class ham of 11 years and have the authority to use up to 1500 watts on 10 meters. He threw the first insult with no logical basis. I think sparky is hurting the cause more than helping it. I noticed that another guy on this NG by the name of voobner who is almost as bad. I encourage people to become hams. It offers a broader range of activity and is easy to get a license nowadays, but I never insult or disrespect CBer's. But unfortunately, there are also many hams who use illegal, excessive power far above 1.5kw. Don't pick fights friend, and don't hide your joy in insulting people behind a supposed aim of observing FCC regs!

As if to suggest making a statement of fact, and being a world class troll
are mutually exclusive, ...there are exceptions to that rule, Aaron.

Yes indeed, you do have the facts on your side...but if that excludes you
from your richly deserved troll status, then think again, you cannot have it
both ways. OTOH this is usnet, as opposed to reality..do with it, what you
will...nobody is really going to stop you from speaking your mind anyway.

Oh yes, Frank S. Aaron who hides out on rec.radio.cb with us dumb cbers
because people on every other newsgroup won't buy into his theories. Ask
Frank Aaron how it is possible to measure SWR on a transmission line
directly with the probes of a DC voltmeter. He got laughed off of r.r.a.a
for that one.

I own 2 of these; the original HH-45, not the ST version. Beautiful hand held radio. Pick yourself up a metal telescopic antenna, and you can get out quite a ways with it. Unit has plenty of features to go around. Even comes with some "extra" features if you get the NON-ST version...

Optional Additions, which are probably going to be near impossible to find anymore, are the 8-cell battery holder with recharge jack, and the home charging unit, to allow for the use of rechargeable batteries. I'm sure that a telescopic antenna can still be purchased somewhere...

Reception will probably be somewhat diminished currently, but that is a problem plague by all CBs currently because of the massive amount of skip during the daylight and evening hours. I'd definitely recommend a telescopic antenna, as with any rubber-ducky antenna, distance is just not the great. Clarity was fine for me. Unit has good volume in my opinion.

I believe the units originally retailed for around $100 to $120. If the unit you are looking at is new, personally, I pay no more than $70 or $80 for it. If refurnished, I'd pay no more than $50. If used, perhaps between $40 and $60 depending on condition.

For Antique Modulation the rule is 4 watts carrier power; no reference is
made to 'dead key'.

I am going to assume that you are under the assumption that anything above
that is 'audio' and therefore exempt. This is a view of AM that became
obsolete sometime in the Coolidge Administration but among swingsters and
swang artists it is but yesterday. NOOP.

I will elaborate if you care about why swingy audio is basic bullshit and
why a goodly part of the output is in fact carrier. That carrier is
subject to the regulation. So the whole swing thing is pretty useless.

Don't let these clowns buffalo you, Duckster. I have done my recreation thing open and above board for years and have no more spam to show for it than anyone else. Dealing with beardless youth of all ages is not that hard nor all that dangerous.

I have to agree with Doc, it would be easier not to mention more productive to rescue the knobs and fill it with concrete.

Get thyself some old Handbooks, partially for the info value but mostly to make some sense of physical layout and have at it. A 4CX250 with about 1500 on the plates will operate in AB1 gangbusterly with a minimum of silly problems if your basic design makes any sense at all. To get much more you have to do things like proper cooling - this tube as I recall likes some fairly high back pressure but not a lot of airflow. And pay some attention to the tank circuits because you probably have way too much drive available on the grid side and plate tanks at 28 MHZ tend to have excessive Q.

One of the problems of pi-sections is that voltages and circulating currents in the tank are multiplied by Q. Normal design for say 20 meters is a Q of 10 and you can buy the coil stock virtually anywhere. But at 10 meters it is really hard to hold the Q below 20 which tends to suggest over-designed caps and tank coils made of 1/8 or 3/16 copper tubing. Needless to say this also implies attention to safety issues because you will get one hell of an rf burn if you live thru the experience.

Most times guys do not wish to get into the metal-bending aspects of amp building and that is understandable although filling ten tube sockets is not exactly simple either. I have found that most of what I need to do can be done on flat sheet using a lot of channels for joinery. So a first-rate Dremel tool and an electric screwdriver are useful as sin but they are useful anyway for all sorts of shenanigans as is one of those Weller butane soldering irons. The tuner being run in Q-street at the moment uses this technique and you can often get basic metal from goofy things like cookie sheets and pizza pans. Dead microwaves are pretty good as well for outer cabinets.

Personally, I like 'long-john' layouts where the grid tank comes into the left side below chassis level and is tuned from the lower left of the panel as you face it, the tube is more or less in the middle with the pi-section on the right with its tuning knobs above chassis level. Ten meters is lo-VHF regardless of the textbooks and lead-length considerations apply.

I would approach the issue first using the spec sheet for the tube and selecting operating conditions which will lead you into the power supply and determine the plate impedence you are matching with the pi-section to determine that, recognizing that the formulas include stray and tube capacitance in the equations (lead dress and Q again). Then it is time to include the grid tank and that is where the men and boys part company although AB1 should not drive your exciter to drink quite as badly as anything that draws grid current.

As noted the power supply of the Phantom is probably useless unless you can get two of them. You can perform all sorts of wonderment with two center-tapped transformers.

The aquisition of amp parts is one of the great sub-hobbies of Amateur Radio. Some guys spend a lifetime and never get around to building them. But the learning that comes of just doing a design on paper is a pleasure unto itself.

Would a Ham callsign not be more appropriate on a Ham group?
As you say, this is a CB group... you cannot have it both ways, ham
information on the group just when it suits you.

So, why should he post it... so he can be traced and sent a used
Jock strap, or so that CBers can bow before him and worship him.

Maybe he does not want either of those things.

No, I meant what I said. Some people are not willing to pay for
anything, they think that the world owes them a living.
If you can get it free, take it... but don't expect it as a right.

===
> >No, he's a freeloader (not to be confused with "freebander").
>
> About the only difference is the spelling.
===

No, Freebanders will pay for their equipment, usually spending far
more on their equipment than most legal CBers do... a freeloader is
not willing to pay, they will expect you to give it away.

===

Aagent Aaron said it was "petty"... take it up with him.

I was simply pointing out that what he was suggesting is not in line with the "AKC" way of thinking. I am sure that he would not want to see his membership cancelled.

Is there anything in the "AKC" members handbook about selling broadcast transmitters for use as Pirate stations?
Do you think that criminal behaviour is "honorable" if done in a forum specifically for such activity?

Brainbuster.

Ah, a denial... that makes it true.
Where do you think up these names, you really are wasting
your story writing talents here.

===
> How could I know more about you than you do?
===

Exactly!!!!!

So, we agree, I know where I live... and the voices in your head
are lying to you. Ask Dave if he can perfom an exorcism for you.

===
> You're EXTREMELY SENSITIVE about being a Brummy. Is that
> my fault? No.
===

You're extremely sensitive about brummies, is that my
fault? No.
Now, lay back and tell Dr. Brainbuster about your childhood,
what made you hate Birmingham so much that you hear voices
in your head and have bad dreams about the place?

===
> Show me a post where I express hate for legal CBers.
===

Every post where you try insulting me... I have made it clear that I
run a legal system, even told people who asked that they did not
need an amp.

Hey, I thought that being a legal CBer brought nothing but abuse from
the "Keyclowns"... I haven't seen any of it... just abuse from the
"pro-legal" mob.

===
> > Pro-legal people,
>
> Bunkum! Show me the post, you scalawag.
===

Can you not see the posts you made to this group... you know
those strings of letters you keep posting to this group.

If you are too lazy to open your eyes, it's not my fault.

===
> > CBers outside America.
>
> Come now old chap, you're getting ridiculous with this.
===

Now if you cannot see how I class as a CBer outside
of America, then you have a serious problem. Try
checking on a globe or world atlas.

===
> > Anyone from Birmingham, UK.
>
> Not ANYONE. Just YOU.
===

But, Aagent Aaron, you are forgetting... That is not where I am.
Or do you mean that "B Swollocks", huh.
Do those voices say that she is in Birmingham?
Do they say that Jock is in Birmingham?

These voices certainly have a thing about Birmingham.
How about the people who Neotraced Jock to London... are
your little voices more reliable than Neotrace?

I know, I must be zipping around the country... London, Birmingham,
Manchester, etc... using internet cafes (who must be very kind
to allow users to chose an ISP to use), using the home computer,
and a ".gov" computer.
Not bad on an "M&S vannie" wage.

Beware the voices, Aagent Aaron... you have gone over the
edge, with your crazy suggestions.
Just how many voices do you hear, Aagent Aaron?

Regards,

Brainbuster.

----- Original Message -----
From: Sparky
Newsgroups: rec.radio.cb
Sent: Monday, June 03, 2002 6:33 AM
Subject: Re: Where's Sparky?

In just over 3 hours, you made 14 posts to the one thread,
including time waiting for the replies... all just to argue
with someone.

In the 20 hours up to when I last downloaded messages, you
made 31 posts to this group. Looking at the posted stats,
my usual is around 62... a month.

Many of your replies were within minutes of the original post you
was responding to... you was so desperate for an argument.
My usual reply time is measured in days, except at a weekend,
when it is hours... and I only post around two or three times over
a weekend.

So, by your own standards, how stupid must you be... waiting
on the newsgroup for the next reply, just so you can argue.

Or is it a different rule for you "Antikeyclowns"?
Is it supposed to be a "free run" for your mob... where you can
insult us, call us names, post lies, use foul language... and
we should not defend ourselves?

What a hypocrite.
Try taking your own advice, before you even consider asking
us to bow down before you and worship the words you utter.

Brainbuster.

278. The three Amigos...

Newsgroup: rec.radio.cb
Date: 2002-06-03 18:35:30 UTC

Message-ID: <adge6m$8e5$12@news8.svr.pol.co.uk>
Source record: 126185

For those who may not realise, here are the credentials of the
"Anti Keyclown" Legal Beagle group...

We have one who is more interested in where someone is than whether they
are legal. This predatory "secret agent" character will attack anything that
moves... even legal CBers, Amateurs, those in other countries and those
that advise against a "linear" for good sound technical reasons rather
than for troll value.
This chap has also been known to send offensive, unwanted e-mails with
attachments, then deny it even though confronted with the proof (he made
the mistake of posting on here within minutes, with the same IP number - an
unusual slip for this "seasoned" troll).

We have another who is only bothered about someone's "sexual orientation"
and will use his own subtle (as a sledge hammer) blend of sexual innuendo
and foul language to attack his victims. As with the above character, this
person will attack anyone on the group, regardless of their position on
illegal equipment.

Then we have the one who will argue, making 17 posts on one thread in just 18
hours... then whine about someone else who only posts a few times in a week.
Said to have technical knowledge, this member prefers to use insults, coupled
with the odd offensive word, as a method of debate.
This "Anti" member, who has had the odd skirmish with the Law, has been
known to offer a transmitter for use as a Pirate station.
But please don't misunderstand, it was OK... it was in a Pirate newsgroup,
designated for illegal equipment and it's use, so was totally acceptable.

As a team, they make a formidable farting force, chosing to whine on a
newsgroup rather than taking real action, such as reporting their local pawn
shops / cb shops / ads papers, etc for selling illegal equipment. Although
the newsgroup only has a small number of the total CBers and years of
whining has not stopped people using the group, they are a pissistant
bunch who take pride in wasting time with hate and insults rather than
actually making a difference.

So, can you all see now, why they are such fine examples of how to live,
how they lead by example, how they show respect in order to get respect
and why we should all kowtow and worship at their feet?

Neither do I.

Brainbuster.

: Hello ! I have a D&A Phantom Dual Power ten tube, 10 meter base amp with all
: bad tubes (they all test to about 30%). Has anyone out there ever heard of
: converting one over to 4CX250B's.

It can be done and has been done with many amplifiers. It's just a question of how practical it is to complete the conversion. You would have to run a full wave voltage doubler (min), be more carefull of the tube requirements and have access to a well equiped garage (or machine shop).

I've got a picture of a 4 sweep tube Dentron GLA-1000 converted over to a pair of 4cx250's.

I would consider a simple retrofit to the EL-509 sweep tube.

: Today true transmitting tubes are far
: cheaper than fragile TV horizontal output tubes.

No they aren't.... I just bought new Sweep tubes for $23 each from Gintares (often found selling them on Ebay) (not my first purchase from him). They are still very cheap and easy to get.

: Since I have 40 or 50
: 4CX--- series tubes lying around and am an experienced ham home brewer I
: think it might be a worthwhile project and challenge. However, not wanting
: to unnecessarily re-invent the wheel I thought I might get some useful
: information from anyone on various newsgroups who has done it before.
: Thanks for any tips.
: 73

I would start with a ground up project first, mo practical...

cheers
skipp

http://sonic.ucdavis.edu

The sonic server has some 4cx250 amp stuff on the Amateur Radio Page.

I've learned more about harmonics and deviated signals from one who took
the time to actually show me something instead of attempting to badger,
embellish, insult and lie about mundane trivial matters in order to
further an unrelated personal agenda.

>Did the knowledge about harmonics sink in? <<

I thank you for the concern.

>Apparently not, <<

And we not only have you talking to yourself but answering yourself.

>because you
still think illegal kitchen-table CB amps are swell.<<

Did you arrive at this conclusion all by your lonesome or did you have
help from another member of my church who has more excuses on changing
ISP's than Billy Carter had liver pills <g>?

If any were to recruit another
into the world of hammie radio, it would be those types that anger you
so.

>Oh stop it. We know you're not interested in being a ham.<<

Of course not, but where do most of the newbies to hammie radidio come
from? CB.

>Licensed amateurs don't owe bootlegers and outlaws any respect or
apologies.<<

Agreed. They certainly owe no apologies, but they owe it to their
service and hobby to do the right thing, and that is through education
and diplomacy

>How about you, Twist?<<

This wasn't about me, it was about licensed amateurs owing freebanders
no respect, you said. Topic change?

> Do you "owe it to your service" to do the right thing?<<

I'll indulge. I have no service. I am an independent radio station. Even
my old sideband group disbanded after the old coots started dying. I
think most of them worried themselves to death about the change taking

place to hammie radio. I still hear some of their numbers being used and I would probably still be using my call they assigned me, but your AKC campaign has made my moniker of "Twistedhed" much more recognizable and easy to remember than a number. I key up and say "Twisted" and quite often I get "is this the same twistedhed from the internet?"...and I owe it all to you and my other rec.radio.cb friends.

Everyone knows amps on 11 meters are illegal. So what? So we have the holier-than-thou schmoes out there trying to convince us that we ought to change our ways. Look, I,ll make it real simple 4 u self appointed cops and monitors or whatever the hell u refer to yourselves as. We know the risks, if we take the chance, most of us are ready to deal with the consequences should the heat come down. I have respect for MOST hams, but I achieve the same results at a fraction of the cost. If I bleed a neighbor, all they have to do is knock on my door. We will work it out. I have been in the same area for quite some years and have no problems. If I am not hurting anyone, why the hell should you care WHAT I do? The bottom line is you shouldn't. Get a life. You guys that bitch about us freebanders and "peaked" radios have way too much time on your hands. I don't need to run anymore than 30 watts where I am located and I talk all over the world......yes.. on the freeband. Nothng pleases me more than one of you cb rambos to come in to my conversation and start preaching about rules. God, I love to squash you suckers.

Many of us live for long distance DX. IF you have a problem with his mode of operating, tell me what frequency and time you will be on. If this poor kid can get you riled by asking to talk skip(GASP!) I can't wait till you hear me. Pick on someone your own size. I'm ready to key all over your whiny, sniveling ass!
Gettin'
WAY-UP from the 'pile<<

What's your point? That you presented half a discussion to present half a dialogue so as only to give an impression taken out of context as you intended? That's nothing new, you do it all the time. Simply present the thread in it's entirety. I stand behind what I wrote. Keep searching. However, I find certain behavior of yours perplexing. Scouring old archives in vain with the hopes of stumbling upon something someone may have posted with no goal in mind other than an attempt to malign whoever holds a view you may happen to not agree with or comprehend, is quite the pathetic novelty.

I'm at a loss. One of those things was a 'linear' rf amplifier for fm.
What is a 'linear' amplifier for FM? I must assume it is so non-linear
that use of ssb or am would result in a signal 100 KHz wide, so it is
for fm only. But, then, why is it called a linear?

Oh well,
73 from Rochester, NY

291. 27Mhz Propagation Model?

Newsgroup: rec.radio.cb
Date: 2002-06-03 19:45:32 UTC
From: Steve Netting <steve-news@moonfoundation.com>
Message-ID: <adgh3ltdp1@newsg2.svr.pol.co.uk>
Source record: 126195
Cross-posted to: rec.radio.cb,uk.rec.radio.cb,uk.radio.amateur

Hi All,

A quick question - I hope someone can help. I've searched the net for a few days but can't find any answers :)

At 27Mhz, under 'normal' atmospheric conditions, I believe the ionosphere doesn't reflect the signal.

Hence, at this frequency, is it fair to assume TX/RX distance is limited to line of sight? With the signal decreasing rapidly as the curviture of the earth 'blocks' the signal...?

If thats correct - then, is it also fair to assume there's a theoretical maximum tx/rx distance at 27mhz? A distance whereby more power would fail to make any difference regarding distance?

If that's also correct - then, how much power would be the theoretical 'optimum'?

I'm assuming a standard dipole antenna (not yagi's) ... and this is purely out of interest. I was discussing this the other day, and came to the conclusion that there must be physical limits, and there must be a model which demonstrates propagation at certain frequencies and power, fitting inside thetheoretical limits imposed by the planet (curvature etc).

I'm unsure if you can cover beyond line of site - as I seem to recall that the atmosphere causes the signal to be refracted slightly, but - am unsure if this is to our advantage or not.

It's probably a huge topic - but if anyone has any ideas I'd be interested to hear them. Sorry if my understandings are incorrect - but as I said, I've had trouble finding answers to any of this on the net.

Many Thanks,

Steve (Bristol, UK)
p.s. If you could cc me directly on any replies - that'd be fantastic - as my news feed keeps losing articles...

Technical knowledge HA! He doesn't even understand something he should have
been taught in his physics course: Superposition. He believes that a
standing wave on a transmission line formed by the interaction of an
incident sinusoidal wave and reflected sinusoidal wave somehow magically
gives rise to a DC voltage. He believes he can measure SWR with a DC
voltmeter placed across a transmission line because of this. He does not
understand that the superposition of these two waves gives rise to a
standing wave which varies in amplitude at the incident wave's frequency.
This is a very basic concept that he does not understand. How can he have
any technical competence? I doubt he even has an engineering degree as he
claims.

Hi,

So - what distance in considered 'line of site' ? It's obviously futher
than one can see if stood at the same height as the antenna :)

Thanks,

Steve (Bristol, UK)

You were obviously absent or asleep when the subject of superposition came up. Or did you just flunk high school physics? Your pitiful water tank analogy falls apart when you try to apply it to standing waves on a transmission line in they way that you have. I suggest you think again about how those standing waves have come about in that water tank.

Since you seem to imply that *you* have been to high school and have taken high school physics, explain to me (a dumb cber) how the superposition of a sinusoidal incident wave and a sinusoidal reflected wave can result in a DC voltage?

Steve, there are many forms of propogation. What you refer to as skip
is F layer reflection and is affected by the time of day, time of year,
and the sunspot cycle (an 11 year cycle). We are on the downward trend
of the latest sunspot cycle, and the maximum usable frequency (above
which the signal will not be reflected back to the earth using normal
f-layer reflection) is on the decline. On good days during a sunspot
maxima, you will find worldwide communications possible up at 50 MHz.
During these times, 11 meters will be open to the world along the
daylight path. You will find even a watt can reach across continents
with no problem at all. No amount of power will help if the skip is
out. That said, there are other forms of 'reflection'. You can have
scatter - this is similar to seeing a searchlight in the sky. You can't
see the searchlight, but you can see the light scattering in the
atmosphere. This also works for radio - out to a few hundred miles, but
does require a lot of power as the received signal will be weak. The
other mode is sporadic e. E-layer 'clouds' can form and act as a
reflector. Although lower than the f-layer, they can allow your signal
to be reflected and you can enjoy communications for hundreds and even
thousands of miles. It will be only in the direction of the 'cloud',
however, and you can communicate over an area determined by the size or
extent of that cloud. This mode does not require much power - a few

watts can do just fine.

-Perfesser's Amp-
(Sung To The Tune Of "Jessie's Girl"
by Rick Springfield)

Perfesser is a friend
Yeah I know, he's been a good friend of illegals all the time
But lately somethin's changed, it ain't hard to define
Perfessers got himself an amp, and I wanna make it mine
And he's designed it Class C with no bias
And it's got spurs like mad, I just know it
And he got his flywheel theory screwed up, late late at night
But Y'know, I wish that I had Perfessers amp
I wish that I had Perfessers amp
Where can I find a design like that?

I'll play along with his charade
There doesn't seem to be a reason to change
Y'know I feel so dirty when Sparky starts talkin' truth
I wanna tell him I'm illegal too but the point is prob'ly moot
'Cause it's designed with no bias
And it's sounds like shit, I just know it
And it was dreamed up when he was drunk, late late at night
But Y'know, I wish that I had Perfessers amp
I wish that I had Perfessers amp
Where can I find a design like that?

And I'm lookin' in the mirror all the time
Wond'rin' when the FCC will catch up with me
Yeah I've been illegal I've been crude and I do lines
Ain't that the way CB's supposed to be?
Tell me, where can I find an amp like that?
But Y'know, I wish that I had Perfessers amp
I wish that I had Perfessers amp
Where can I find a design like that?
Like Perfessers amp
I wish that I had Perfessers amp!

305. Newbie Q's: installation and use

Newsgroup: rec.radio.cb
Date: 2002-06-03 21:51:09 UTC
From: Jeff Goslin <autockr@comcast.net>
Message-ID: <hxRK8.43642$4i.5020027@bin2.nnrp.aus1.giganews.com>
Source record: 126211

I found the FAQ, but had some questions that just weren't on there.

I'll be doing some cross country driving along some major highways, and know that the truckers know where the cops are and communicate that to each other. I'd like to be able to use that information as well, but don't want to "ask for the info in the wrong way" if there is a wrong way or a right way. Is there a standard jargon for asking for a speed trap report on a given stretch of highway? Accidents that might be up ahead? Traffic in a region? etc etc.

Also, how far (miles/km's) is the range of a CB radio on a car given a "standard" mount for the antenna. Just a ball park figure, please. I read in the FAQ that it depends on what kind of mounting you have for the antenna, and that it depends on how long the antenna is, but no distance was ever given.

BTW, how long is a standard CB antenna? I've seen some pretty long ones on cars(appear to be about 8 feet long or so). I assume longer is better?

Also, the FAQ mentioned that the bumper mount is the worst place to put an antenna. Why is that? The FAQ mentioned that central and higher is better, but it didn't say why. One would assume that simply higher is better to get radio signals in general, but central to the vehicle would seem to this admitted newbie not to make much of a difference. It would seem to me that the bumper would be a most convenient place to mount an antenna, especially one you wanted to actually get into a garage with, without tearing it off. If it is that much worse than any other place, how much worse are we talking about? Range reduced 50%, signal noise, etc etc?

Thanks in advance for your patience answering these newbie questions.

as well. Dont know prime minister

307. Heil mic/footswitch to 2950?

Newsgroup: rec.radio.cb
Date: 2002-06-03 22:06:23 UTC
From: grtpmpkin32@aol.com
Message-ID: <20020603180623.15610.00002586@mb-ct.aol.com>
Source record: 126213

I've got a really nice sounding headset from Heil, with the HC5 element and the footswitch to PTT. It was wired for a Kenwood xcvr, but I want to use it on an RCI2950, which is six-pin instead of eight like the Kenwood.
I know what the pin-outs are, but am wondering, will the footswitch work for PTT without having to add relays or anything?
I guess I'm asking if anyone has used a hands-free mic system with their 2950, and how they accomplished this, or at least, let me know if it's fairly simple to accomplish or not.
Hope to get some help, thanks! :-)

What do you know about CB IceColdDildo? That the SuperBowl is Channel 6 ?
How to turn your amps on?

I *think* those mics require 8VDC to operate. If I remember properly, they are electret elements. I'm not positive, but you may want to check into this before going any further. It may complicate the issue somewhat, but it's certainly still doable.

Durring the day, you may get up to 2 miles if you are lucky. Skip and
background noise conditions are pretty high durring the day, and tend to
drown out signals further away than that. Depending on your choice of
antenna, and mounting location, you could actually cut your signal down to
as little as a 1/2 mile.

>
> BTW, how long is a standard CB antenna? I've seen some pretty long ones

Longer is better. I wouldn't bother with an antenna if it is any shorter
than 4 feet. I'd have to say that that should be the MINIMUM length you
should looking for. This length is for the antenna ROD only. Anything
below the antenna coil doesn't count. A good antenna for example is the
Wilson 1000. It has a rod of 5'3".

>

I'm not sure of exactly how much signal you would loose, but 50% sounds like a good figure to me. The problem with bumper mount is that 1) the antenna would be too close the metal body of the vehicle, thus the vehicle would absorb most of the transmitted signal, and 2) the antenna needs to use the metal body of the vehicle as a ground-plane. The transmitted signal would be very directional with a bumper mount antenna. The signal would tend to transmit better in the direction of the most metal. This is also explain why the berst place is in the center of the vehicle. A centrally located antenna would give you the best transmition pattern; more evenly distributed.

If there would be a problem with garaging the vehicle with an antenna, then your best bet would be to go with a magnetic mount. This way you would be able to remove the antenna for parking purposes, as well as help in preventing it's theft.

> Linus

It gets wired up just like any other mike, the foot switch is the PTT, think of it that way and it is easy to hook up... You will need to run a wire (2C) from the mike plug to the Footswitch, just get a 6 pin plug and go to town it is like hooking up any other mike. You will only use 3 or 4 pins.but you will need to run a sepearte wire from mike plug to footswitch as your PTT.

The Heil is a dynamic mic nothing fancy needed, unless you have an Icom.....

HC-4 Specifications:
Type: - Dynamic. Copper wound bobbin, moving coil transducer
Frequency: 500 Hz to 3,800 Hz with 10 dB rise at 2,000 Hz.
Sensitivity: -66 dB Nominal
Impedance: 2,000 ohms @ 1,000 Hz.
Size: .530 x .850 x .310

HC-5 Specifications:
Type: - Dynamic. Copper wound bobbin, moving coil transducer
Frequency: 350 Hz to 4,000 Hz with 6 dB rise at 2,000 Hz.
Sensitivity: -68 dB Nominal
Impedance: 2,000 ohms @ 1,000 Hz.
Size: .530 x .850 x .310

> than one can see if stood at the same height as the antenna :)

Yep. It's "line of sight", not "site".

The "usual" formula is tha the radio horizon in miles is 4/3 times the square root of the height in feet. Then there are about 100 "buts" to go with that.

First, terrain, hills, etc can affect it.
Second, propagation can affect it.
And so on.

In short, you might find that your 27MHz signal will get no further than a few miles one day, and will reach 5000 miles away the next day.

You'll be limited in what you can do with that range, using "standard" CB equipment. If you want to work the world, then you need to do some study and join the ranks of radio amateurs. We can use equipment which will easily span the globe.

You'll find most amateurs friendly and welcoming - but there are a few who hide in newsgroups who will hurl insults at you for all they are worth. Ignore those.

Best of luck.

Keith

Linus,
All you need is an appropriate mic plug, and a couple of in-line jacks of the appropriat type. Wire the mic-plug for the '2950 with 'pig-tails' ending in the right in-line jacks for the headset and PTT switch. (doing it this way also makes it easy to swap mics, just need the right plugs to fit the in-line jacks)

Steve,
You might do some more reading. 27 Mhz is not
'line-of-sight', it ~is~ reflected by the various
ionization layers. A 'line-of-sight' frequency
isn't characterized by distance, but by relfection.
It also isn't characterized by an abrupt difference
in reflection, but by a gradual one dependant on
frequency and the state of propagation at that
particular instant. It can change, and does.

A quick question, but a very lengthy, vage and theoretical answer :o)
I was once very interested in this subject myself. But not for CB, for the HF amateur bands. You often see ground wave maximum range for VHF and UHF shown as a graph, usually to demonstrate how much better 50mhz would be than 145mhz for mobile use. The range increases dramatically as the frequency drops below about 100mhz.
I once intended to do a college project to extend the graph down to 1mhz, but never got the opertunity.
But in answer to your question, there is no definitive answer, or more accuratly, there are many answers. Everyone will give you a different one. Any good mariner will tell you, the horizon is 23 miles away. On 27mhz you can transmit that far and a bit further. If you get higher, you can reach further, if there are things in the way it wont be as far. Not very scientific, but as good as you can expect on a CB news group :o)

As most know, I could care less as to the legality of amplifiers! What you are wanting to do to that Phantom has been done many times as sweep tubes became more $$$. You ARE looking at a total gutting of the box and for all intents and purposes you will just end up using the shell as a box for an entirely new unit! The unit as it was built was never meant to run with much else than 6MJ6 or is it 6JM6.....i can never remember....But the HIGHLINE of the 6LQ6 family. I have seen a few D&A amps not take to kindly to 6JE6C's and the like. Best bet is to either retube it with what it should have and spend 400-500 doing so or gut the thing and build a whole new unit in the old D&A box.
Train
I keep getting called one of "them amp guys" so it was fitting that I should reply to this .

What kind of "experienced home brewer" are you that you didn't even consider the requirements of a 6LQ6 compared with those of 4CX250 and immediately see that it would be easier to build, say, a 10 thru 80 meter ARRL handbook amp from the ground up? What kind of a ham would contemplate this kind of effort to produce an amplifier that covered only ONE band? What kind of ham would identify an amplifier as a "10 meter base amp"? What kind of ham hangs out in CB newsgroups calling himself a "Duck"?

Oh never mind.

I'll bet Frank Aaron is begging his mommy to help him get out of this latest display of technical ignorance. I would like to know how he came to the conclusion that a standing wave on a transmission line is DC. This shows a fundamental ignorance of wave interaction on his part. The truth of the matter is that the standing wave has the same frequency as the incident wave. A DC voltmeter is not going to measure the standing wave without an RF probe (or some kind of rectification of the RF standing wave which varies in amplitude at the incident wave's frequency). This can easily be verified by connecting a DC coupled oscilloscope across a transmission line. There is no DC component. I'll bet he hasn't done this experiment. He probably doesn't even know how to use a scope. And he chides me, a dumb cber, for not understanding wave interaction.

There is nothing open for interpretation. Don't you think that many have tried to get Aaron TOSsed? What makes you, a person who openly violates federal law, think you can succeed where so many have already failed? Even on the slim chance that you do manage to get him removed from one ISP, do you intend to petition all his successive ISP's? Doing that repeatedly might be considered harassment with the intent to inhibit his right to free speech, but of course you couldn't care less about such legalities, right? You just want to practice YOUR free speech, illegal as it may be, without anyone responding with facts or pointing out your crimes.

Yeah, Brian, we'll see just how his ISP responds, won't we?

For starters, the limit for a CB (not 11 meter) transmitter (the receiver is regulated only for spurious emissions) is 4 watts RMS while modulating AM. If your RMS meter moves on AM then your transmitter isn't running A3 either by accident or design. If by accident then you need to get it fixed. If by design then it is no longer legal for use on the CB.

Well, this is just a guess (since I have no clue who Z-Duck is), but maybe
he had an idea of what he wanted to do (breathe new life into an old amp),
and then decided to fish around to see if anyone else had done it. Why
build an amp from the 'ground up' if you don't need to? But it's easier to
pick nits, eh?

> What kind of a ham would
> contemplate this kind of effort to produce an amplifier that covered
> only ONE band?

Well, this is another long shot, but I'll refer you back to answer #1.

> What kind of ham would identify an amplifier as a "10
> meter base amp"?

Maybe because that's what the amp refers to itself as?
(another long shot but who knows, maybe I'll be right on a couple of these).

> What kind of ham hangs out in CB newsgroups calling
> himself a "Duck"?

Hrm...
What kind of person has appointed themselves the de-facto Jiminy Cricket of
rec.radio.cb and is giving decent hams a bad rap all over? Funny thing is
most hams I've met have been very nice, and have made me want to become a
ham. Luckily I met them before reading your ramblings...
And before you think I'm one of the sorts that run just this side of 'legal'
(picture fingers pinching close here), I actually run barefoot and don't
transmit on any 'freeband' frequencies, I just find it irritating how people

that have nothing better to do take it upon themselves to become the moral barometer in a newsgroup where they're neither wanted or actually taken seriously.
Just my .02ï¿½ anyway. Take it as you will.

Whatever Frank Aaron.

Explain how the superposition of an incident traveling wave and a reflected
traveling wave can give you a DC voltage. Where in your textbooks does it
say that the standing wave can be measured with a DC voltmeter or even has a
DC component? The standing wave is still an AC voltage (or current) that
varies in amplitude at the frequency of the incident traveling wave.

Just like a freebander. They don't want to spend the time, money and
effort to get a license and operate on legally assigned frequencies,

and they seem to think that if the "freeband" is well used then the
legal designates for that band will just give it away. Sounds like a
freeloader to me.

>
>Is there anything in the "AKC" members handbook about selling
>broadcast transmitters for use as Pirate stations?

I don't know, I have never seen the handbook. But on the other hand, I
still own my Catel (which, BTW, is not a transmitter, but a modulator
for use with closed cable systems. It wouldn't hurt to do a little
research before you jump to conclusions.)

>Do you think that criminal behaviour is "honorable" if done in a
>forum specifically for such activity?

Let's consider an example: "criminal behavior done in a forum" would
mean that it is the discussion that is criminal. So to pick a type of
"criminal discussion", I'll choose advertising CB amps which is a
crime because of CFR 2.815. A forum with the sole intent of illegally
advertising equipment that is illegal to manufacture and operate on
the CB, sold to people with the express purpose of violating federal
regulations, and undoubtedly causing god knows how much interference
to other electronics. Do I think that is honorable? OF COURSE NOT, you
dope!

LOL.

I'll bet Frank "Sparky" Aaron can tell you how much blower cfm you need.
He is a physics expert. And ask him about measuring SWR with a DC
voltmeter.

Oh sure, that's why you're in a CB newsgroup asking CB'ers (who are
prohibited by Federal Law from running external amplifiers) for their
advice about using voltage doublers in a "10 meter" amplifier". LOL.

>Please don't make assumptions about what someone is considering.

One can make reasonable assumptions based on observations:

1. Won't give callsign.
2. Posting only to CB newsgroup.
3. Looking for "10 meter base" amp advice - in a CB newsgroup.

If you ARE what you say you are you are certainly going about it the
wrong way.

>Thats what I mean.....a lot
>of your responses are more emotional than thought-out.

You're not exactly a shining example of "well-thought-out" processes
yourself.

>Your Friend

>been taught in his physics course: Superposition. He believes that a
>standing wave on a transmission line formed by the interaction of an
>incident sinusoidal wave and reflected sinusoidal wave somehow magically
>gives rise to a DC voltage.

Of course not, you idiot. The superposition "gives rise" to an
-average- potential difference between the two points on opposite
sides of a transmission line. It can be measured with a DC meter
because a DC meter doesn't work like a strobe on a wave tank (unless
it is a sampling meter, but that isn't what I was talking about, and I
don't think anyone besides yourself would assume otherwise).

> He believes he can measure SWR with a DC
>voltmeter placed across a transmission line because of this.

I do, because I have verified it to be a fact.

> He does not
>understand that the superposition of these two waves gives rise to a
>standing wave which varies in amplitude at the incident wave's frequency.
>This is a very basic concept that he does not understand.

I understand it well, but you failed to realize that there is a
standing wave on the other side of the transmission line, and that the
reflected waves are not 180 degrees from the incident. Does your
wavetank manual explain the phase relationships of parallel reflected
waves when the individual incident waves are not in phase? Obviously
not. But instead of trying to sort out all those radians and

polarities, why don't you just do the experiment and see for yourself? After that thread I talked four other people into doing the same experiment, and they were all suprised to see their DC meter move on a twin-lead carrying standing waves. I guess that wouldn't be practical though, because even if you did try the test you would lie about the results to justify your ranting. So be it.

> How can he have
>any technical competence? I doubt he even has an engineering degree as he
>claims.

Doubt it all you want. The fact that you are obsessed with me because you can't understand something technical is proof that you are a twit, and of that I have no doubt at all. But I am glad that you have refrained from stalking me for the past few months. I hope you can stay with the therapy treatments because they will help you in the long run.

>> This "Anti" member, who has had the odd skirmish with the Law, has been
>> known to offer a transmitter for use as a Pirate station.

I am also known for offering to build custom CB amps. Alas, I have sold nor built anything of the sort, but that really doesn't matter to someone just looking for a reason to complain.

Legitimate in the sense that a tiny percentage of sales go to amateurs
who actually use them legally rather than convert them to 11 meter
bootleg use?

Of course, I forgot. In The Twistedhed World, no one (except
Twistedhed) may assume anything because nothing is real.

Feel free but the regulation will be cruddy to say the least. Make it
sound like an 11-meter amp not a 10-meter one.

Ground wave isn't what decides maximum range at VHF, Jack. Ground wave at lower frequencies can be many times the "line of sight" range. Back to the textbooks, methinks.

Your "ground wave range" study would be an extremely difficult project, because the ground wave at lower frequencies is highly sensitive to antenna type, radiation angle, ground state and type, and many many more factors. If you define ground wave as "everything up to the beginning of skip distance", you could be looking at 2000 miles at the lower end of that spectrum at certain times.

I misspent a chunk of my youth playing with DX on 160m, and soon realised that you cannot predict how propagation will be from one day to the next. Your ground wave graph would have a lot of uncertainty, to the point I suspect the professor marking it would tell you it's inconclusive.

Finally found out what a Phantom was. Believe it or not it was type accepted for 27 for the cabs which presumably means it was Class C FM but maybe not, there were a number using Ancient Mary. Thanks to the back channel.

Apparently it came in two versions WRT the power supply, one with three xfmrs, one with two and separate filament etc supply. In either case you are in business. My guess is that they paralleled two or three xfmrs at about 700 which means you can series the secondaries to get to 1400 or so. If you have the 3 version I would pull another stunt. Use two in series and the third in a standard full-wave (if CT is available) to get 350 or so for the screens and pump this into the CT of the two in series to get up to 1750 or so for the plates. GE used this caper in their base FMs to prevent screen voltage without plate voltage and reduce the plate in the absence of screen voltage. If the xfmrs had 5volt and 6.3 filaments some unused windings will get you enough that with a voltage doubler you can get the -45 or so of bias needed for AB1 which does not draw grid current so bleeder current is about all there is. Or if you watch polarities very carefully or use an isolation xfmr get the bias off the line. You also will need some keying voltage as well.

The Phantom probably drew something in excess of an amp at 700 volts which means the tank is designed for about 400 ohms and 1750 at 400 ma will give you an input impedence ((V/I) * 0.6) about 2500 in AB1 so you need to dig out the formulas for the output pi and I do suggest 1/8 tubing at minimum and more likely 3/16.

Check the Eimac site for cooling requirements. For Antique Modulation or digital stuff you are right at the bloody edge so follow their requirements. Much like the major function of a thermostat in a car is to keep the coolant around long enough to pick up some heat rather than blast

thru the engine, these tubes do have some fairly stringent requirements for flow and back pressure. Sideband is not quite so pissy but do it for the drill anyway. Eimac sockets and chimneys are not all that cheap.

The grid input I will leave to you because I have no idea what you are driving it with but be forewarned that the 4CX series are pretty much 'blow on the grid' in AB1 and real easy to over-drive. They are also very particular WRT filament voltage as directly heated cathodes tend to be.

You should shunt feed the system which means several things. First off the inevitable protection against a shorted coupling cap to keep 1750 volts off your antenna and a check with a GDO to be sure the RFC is not self-resonant in an amateur band in case you decide to add some coil stock and a bandswitch and use it on 20 etc. This is primarily why I suggest great shitpots of research before you cut metal: there are a lot of goofy things that can bite you in the butt. If you understand why some designers did the things they did you will experience any number of whacks on the side of the head and think 'Thanks I needed that'.

Good Luck

And this is precisely why it is sometimes better to build from scratch,
than to try to make another design "fit". By the time you're through
with all the modifications to support the new tubes, it might've been
easier to start from scratch.

The rule is 4 watts of carrier power, with no more than 100% modulation
on AM. 100% modulation results in a peak power of 16 watts. So if your
"swing" is more than that, you are illegal.

> textbooks, methinks.

I was aware of my incorrect terminology. However this posting was in reply to a CB radio operator on a CB news group. I neglected to notice I was crossposting to uk.r.a. Some terms have different meanings within CBing circles. This is normaly due to the origonal users of these terms misunderstanding the true "amateur" meanings, and without correction the incorrect terms become established to mean something else within a different group of people. This can lead to confusion on both sides, as I believe the incorrect use of the term QSK has caused some high blood pressure lately. I dare say the gradual modification of words meanings has happened since the beginning of language so we should try and be patient when misunderstandings arise.
Hence "ground wave".

And yes the project would have been difficult and possably inconclusive. So its probably just as well I didnt do it. But isnt it just as valid to prove you are incorrect in a logical manner than to find yourself correct? :o)

Again with the name calling. You must be really upset.

> The superposition "gives rise" to an
> -average- potential difference between the two points on opposite
> sides of a transmission line.

LOL, where did you get your engineering degree? This is total nonsense.
There is a potential difference between the hot an neutral wires in your
home wiring but you cannot measure it with a DC voltmeter. The "potential
difference between two points on opposite side of a transmission line" is
still an AC voltage.

>It can be measured with a DC meter

It can be measured with a DC meter and a RF probe. If the incident wave
frequency is 1 Hz or so maybe you will see your DC meter's needle wiggle a
bit.

> because a DC meter doesn't work like a strobe on a wave tank (unless
> it is a sampling meter, but that isn't what I was talking about, and I
> don't think anyone besides yourself would assume otherwise).
> > He believes he can measure SWR with a DC
> >voltmeter placed across a transmission line because of this.
>
> I do, because I have verified it to be a fact.

Only in your dreams. Place a DC coupled oscilloscope across the transmission line and you will see that there is no DC component. You will see an AC voltage whose amplitude is determined by the superposition of the incident and reflected voltage.

> > He does not
> >understand that the superposition of these two waves gives rise to a
> >standing wave which varies in amplitude at the incident wave's frequency.
> >This is a very basic concept that he does not understand.
>
> I understand it well, but you failed to realize that there is a
> standing wave on the other side of the transmission line

More nonsense. What does "standing wave on the other side of the transmission line" mean? Where does this "standing wave on the other side of the transmission line" in imaginary space? Another dimension? To measure the standing wave you have to measure between the two conductors of the transmission line - where does this other standing wave exist then?

>, and that the
> reflected waves are not 180 degrees from the incident.

What does this have to do with your idea that there is a DC potential difference between two points on a transmission line?

It depends on whether you are referring to the reflected current or voltage and the particular load terminating the transmission line. In the case of a transmission line terminated in an open circuit the incident and reflected voltages are in phase and the incident and reflected currents are 180 degrees out of phase. Still there is no DC potential difference between the two conductors in a transmission line.

> Does your
> wavetank manual explain the phase relationships of parallel reflected
> waves when the individual incident waves are not in phase? Obviously
> not. But instead of trying to sort out all those radians and
> polarities, why don't you just do the experiment and see for yourself?

> After that thread I talked four other people into doing the same
> experiment, and they were all suprised to see their DC meter move on a
> twin-lead carrying standing waves.

Just like an info-mercial with all those glowing testimonials.

> I guess that wouldn't be practical
> though, because even if you did try the test you would lie about the

> results to justify your ranting. So be it.

So if anyone actually performs this test and fails to read a DC potential across the transmission line you will automatically assume they have lied about the results. How convenient for you. You are a true believer.

> > How can he have
> >any technical competence? I doubt he even has an engineering degree as he

> stay with the therapy treatments because they will help you in the
> long run.

I am sure that you think everyone who successfully debunks your nonsense is stalking you. How many people on this newsgroup have you accused of stalking you Frank Aaron? There are medications that can help you.

It is true, though, that you are technically incompetent. Your "measure SWR with a DC voltmeter" theory is proof enough.

If you can measure a DC potential difference between the two conductors of a transmission line then show me the math that proves that the interaction of two sinusoids has a DC component.

Frank "Sparky" Aaron is also technically incompetent. Ask him how you can
measure SWR with just a DC voltmeter.

Not noticed, but that may be because I'm not reading the newsgroup where it happened. I've been using "QSK" since 1960, and I've always meant "I can hear through my morse, just interrupt".

> I dare say the gradual modification of words meanings has happened since the

> arise.

Yep. It's the science (art?) of philology. I did my degree in it, long years ago. But there's a difference between redeploying a word to cover a new concept or object, and careless misuse of one word for another. The former is essential, the latter requires correction.

> Hence "ground wave".

Which means something different from "line of sight signal".

> And yes the project would have been difficult and possably inconclusive. So

> All I have seen are CB manufacturers clams on good quality. Cobra has a
> good sounding collection but is it better?

For under $100, you can get a good one. If you are just looking for a
regular AM CB, then something like a Cobra 25 would be perfect, or if
you're looking for "non traditional" looking CB's, then something like
a Cobra 19 or 18. They will all sound good.

If you are looking for something with side band, well, ya may have to
go used, and get something like a Cobra 148, or something in that
nature.

Hope this helped,

Rob - linx!
linx@rednecks.com

Yes, I am a pure Cobra man.

At 27 MHz there is some ground wave and some direct wave propagation
(ignoring 'skip'). To get ground wave propagation you really need a
vertically polarised aerial and at 27 MHz it doesn't really work very
much anyway.
The direct wave propagation should be limited to line of sight but
there is refraction and also diffraction over hills.
Ground waves follow the surface of the earth. This means that height
has no effect on the signal strength. 27 MHz propagation isn't like
this. If you get nearer to the side of a hill the signal gets worse,
even though the distance to the other station is less. This is a sign
of diffraction. There is also some reflection off buildings and hills,
nothing like as much as there is at UHF but it can be noticed in some
areas on 27 MHz that there are standing waves (fading every 18 feet
along a straight road).
The range (at a percentage of locations) is calculated from the power,
receiver sensitivity, height above average terrain*, surface
roughness*, frequency and aerial gain.
The range is just an average and it will be less than the free space
theoretical range.
* - HAAT, average terrain is for a few miles around the transmitter.
** - surface roughness, deviation from average terrain over the tx -
rx path.
To go from 50% of locations up to 90% of locations would need a
certain increase in power. For something like CB, 50% of locations is
the figure to use, broadcasters would use over 90%, there is something
like 50 times more power needed for this.

Some questions about the Cobra 45WX mod which adds the upper and lower frequencies. When making the modification how are the "jumpers" applied? Is this a piece of wire that is soldered on? I read one posting which indicated that this was just a wire (like test leads) temporarily placed between the two contact points? Does the jumper have to be place when the C506 is jumpered to reset the unit? How is the modification reversed? Also, is this a legal or illegal modification?

Thanks

Why would I not admit it? Not admitting it would leave me open to being
criticized by others who are able to repeat the same measurement with
positive results (positive meaning reading a DC potential). If I was able
to measure a DC potential across a transmission line which corresponds to
the standing wave on the line then I would have to revise my understanding
of the superposition of incident and reflected voltage and current.

The math tells me that there is no DC potential caused by standing waves:

In a open circuited transmision line

incident voltage wave = A* sin(k*x-2*pi*f*t)
reflected voltage wave = A * sin(k*x+2*pi*f*t)

The superposition (which is the standing voltage wave) =

u(x,t) = A*sin(k*x-2*pi*f*t) + A*sin(k*x+2*pi*f*t) =
2*A*sin(k*x)*cos(2*pi*f*t)

sin(k*x) is the fixed spatial form the oscillates with variable amplitude
2*A*cos(2*pi*f*t)

At points k*xn = n*pi, u is zero (nodes)

At points k*xa = (n+1/2)*pi, u OSCILLATES over a maximum range (antinode).

The standing wave has no DC component.

Would you agree that replacing the DC voltmeter with a DC coupled
oscilloscope and repeating the experiment is equally valid? I have both a
HP 410C VTVM and a TEK 2235 scope so I can try the experiment both ways.

Using the scope would eliminate any measurment errors caused by possible rectification of RF by the DC voltmeter. Actually I beleive that if you did read a DC potential it was because your DC voltmeter was rectifying the RF voltage internally giving the same result as a DC voltmeter and a RF probe.

I have actually measured the SWR of a transmission line using a method similar to yours - find the maximum RF potential across the line and then move 1/4 wave up or down the line and take another RF potential measurement. But this was done with an HP 410C VTVM and HP 11036A RF probe.

Tim,

I have the Channel Guard installed in my Lincoln and Grant XL. Did it make a big difference in the Lincoln? It's hard to tell since the offensive bleedover, for which it was designed to combat, hardly exists on 10-meters. It supposedly adds and extra stage of amplification to the receiver chain, thus pulling in signals that would normally be indistiguishable from the background noise. Whether or not this is marketting folly, I'm not sure. I have, however, pulled in some pretty weak ones.

Now on the Grant, it's head and shoulders above the rest. I can hold a local conversation on channel 5 with the local "Kilowatt Charlie" jabbering away on channel 6...nuff said! Also, on channel 38 LSB, I've worked some very low signals that I'm fairly sure I wouldn't have stock. Bear in mind that I don't work for these people, I'm just a very satisfied customer. Hope this helps.

> I've been using "QSK" since 1960, and I've always meant "I can hear
> through my morse, just interrupt".

Among CBers, QSK is one of the terms used to break in on an existing voice contact. A modification of the term to suit a band where CW is never used :o)
Although whats really annoying people is that on CB breaking in on a contact is quite acceptable, and in areas of low activity is positively encouraged. However if this habit is taken onto the amateur bands, where it is not acceptable, it can make the newcomer less than popular. I feel in these days of "fast track" licensing, this should be made very clear to students, so they dont tread on anyones toes.

> > Hence "ground wave".
>
> Which means something different from "line of sight signal".

Indeed.
But for anyone who's interested-
On CB a "skip" contact is any contact made using atmospheric propagation, regardless of type or layer used.
A "ground wave" contact is one made within the normal short range of the station, without the assistance of atmospherics.
This may be subject to regional variation, but is generally correct.
Its not surprising that on a band which is intended for operators without a technical interest in the subject, that the terminology is simpler, if a little incorrect. CBers merely need a term to describe an occurrence, rather than analyse it.
I hope this may save a little confusion in the future.

PS, I mean no disrespect to those CBers I know who do have a deep technical interest in radio. But face it guys, your in the minority :o)

Check this out:
http://www.glenbrook.k12.il.us/gbssci/phys/mmedia/waves/swf.html

You will see graphically what I have described in the math above. It shows
that the standing wave is an alternating voltage.

I would not say that breaking in on another communication is not acceptable.
For example, in CW we have 'K' and 'KN'. The 'KN' requests that only the
original party respond.

With voice, it is a bit different. A person requests that they be allowed
to enter the conversation - usually by just announcing part of their call.

LOL George, I never claimed to be a "RF demi God". All I claimed is that I
am a dumb cber. Looks like you are trying to discredit me, but you goofed
up by not paying attention:

If you had been following this dicussion you would have seen that on
6/3/2002 at 10:01 PM I posted the following (verify it on google groups):

From: "jicon_101" <jicon_101@yahoo.com>
Newsgroups: rec.radio.cb
Subject: Re: Where's Sparky?
NNTP-Posting-Date: Mon, 03 Jun 2002 22:01:52 EDT

"The truth of the matter is that the standing wave has the same frequency as
the incident wave. A DC voltmeter is not going to measure the standing wave
without an
RF probe (or some kind of rectification of the RF standing wave which varies
in amplitude at the incident wave's frequency). This can easily be verified
by connecting a DC coupled oscilloscope across a transmission line. There
is no DC component. "

Notice that I mentioned rectification of the standing wave before Roy
Lewellan (or others) responded to my question on 6/4/2002, 09:50:10.

I am glad you brought this up. I was waiting to get a few more responses,
but I will post the result anyway. I posted a message to r.r.a.a,
sci.electronics.design, sci.physics, sci.physics.electromag, and sci.skeptic
hoping that may just one person would agree with Frank or maybe one of the
four people who Frank says has verified his claim would reply. So far there

have been 12 responses to my message with not one person supporting Frank's claim.

This is the message that I posted(notice I did not mention any names to protect the guilty):

I am having a disagreement with someone over his claim that you can measure the standing wave ratio (SWR) on a transmission line with a DC voltmeter.

This is the method he has outlined:

"Locate the point across the twinlead with either the greatest or least DC potential. Measure it. Move the probes one-quarter wave up or down the transmission line. Measure it. Do the math."

He explains:

"SWR is the ratio of Vmax to Vmin on the standing wave. The wave doesn't move (standing?) and can be measured as a DC potential. It's easier to measure on twin-lead since you don't have to poke through the shield, but you can indeed measure SWR with a
DC voltmeter."

I said the superposition of an incident sinusoidal wave and a reflected sinusoidal wave results in a standing wave that is still sinusoidal which varies in amplitude at the frequency of the incident wave. You could measure this with a RF probe and a DC voltmeter, but not a DC voltmeter alone because the standing wave has no DC component. I asked if he was saying that the superposition gives rise to a DC potential and this was his response (with insults edited out):

"The superposition "gives rise" to an
-average- potential difference between the two points on opposite sides of a transmission line. It can be measured with a DC meter because a DC meter doesn't work like a strobe on a wave tank (unless it is a sampling meter"

I said that I think that he does not understand that the superposition of these two waves gives rise to a standing wave which varies in amplitude at the incident wave's frequency. There is no DC potential. This is his response:

"I understand it well, but you failed to realize there is a standing wave on the other side of the transmission line, and that the reflected waves are not 180 degrees from the incident"

I have no idea what "there is a standing wave on the other side of the transmission line" means, but I am pretty sure that there is no DC component on a transmission line caused by standing waves and the "-average- potential difference between the two points on opposite sides of a transmission line" is not measurable with a DC voltmeter.

Am I missing something? I thought I was paying attention in my high school
physics class when we got to the subject of superposition.

Here are the responses so far (verify them by doing a newsgroup search):

This is obviously spun from whole cloth and entirely unexposed to
experience. Ask for a demonstration of this simple concept and watch
the embarrassed squirming.

73's Richard Clark, KB7QHC

Date: Tue, 04 Jun 2002 09:50:10 -0700

You are correct in your explanation of standing waves, and that there is
no DC potential.

It is of course possible that a DC voltmeter might register something
when connected across a transmission line, due to rectification of the
RF by the meter's front end. But what it reads couldn't be relied upon
as being proportional to the RF voltage.

Roy Lewallen, W7EL

There is no DC. You can use a voltmeter in combination with a rectifier
diode and either a slotted line or a variable line stretcher to locate
the maxima and minima of the standing wave. The VSWR is calculated from
the ratio of those two voltages.

Don Pearce

e
> the standing wave ratio (SWR) on a transmission line with a DC voltmeter.

Maybe his dc meter has rectification that he doesn't know
about. The old moving element meters often had a reverse
biased diode across the meter movement to protect against
reverse current.

> He explains:
>
> "SWR is the ratio of Vmax to Vmin on the standing wave. The wave doesn't
> move (standing?) and can be measured as a DC potential.

no

> I said the superposition of an incident sinusoidal wave and a reflected
> sinusoidal wave results in a standing wave that is still sinusoidal which
> varies in amplitude at the frequency of the incident wave.

yes

> Am I missing something? I thought I was paying
> attention in my high school physics class when we
> got to the subject of superposition.

just that the "dc meter" might rectify.

No, you're right.
The forward and reverse waves sum up, and the sum of 2 sin, same freq, waves
is a sin wave (or zero) and this at *each* point of the T line.

If you want some DC to appear you have to mix the waves in a non linear
device, which your T line is not.
You *have* to use an RF detector before your DC to visualise the standing
waves, *unless* your DC voltmeter is itself rectifying some of the picked RF
input.

Just say him to plug a scope in place of the voltmeter, and he will see
there's no DC at all.

Fred.

You're right, he's wrong. Ask him why a standard analogue SWR meter has an
rf
rectifier feeding the meter movement. The answer is cos it won't work
without
one !

Chris

Dumb question, but why would one measure alternating current with a
direct-current meter?

Bob
k5qwg

Sure you can do this with a DC voltmeter. Your friend forgot to mention one
little detail-- you have to touch the probes to the twinlead for a very
short time-- say about 1 nanosecond. Then read off the DC value. Ignore
the sign. Do this about 10 times and average the results.

I agree with you again. It is hard to see what would determine the
polarity of this alleged potential.

> Am I missing something?

I do not think so.

I believe a light bulb works quite well as a SWR meter.

I measure RMS RF with a DC voltmeter. 'Course I have an RF probe ahead
of it.

I suspect the confused person has seen a graph of a standing wave and
assumed it was DC.

George, here is an even simpler answer for you and your short attention span - peer review. Read the responses fro yourself. Not bad for a dumb cber who half slept through high school physics. Of course I knew what the answer would be before I seeked "there (sic) approval".

This is correct; he's wrong. A slotted line generally uses an RF detector
diode built into the moving probe carrier.

It's sad to watch this little drama play itself out. Dick once made a
valiant attempt to teach some of the more subtle points of radio and
electronic theory to the keyclowns. But all the keyclowns want to hear
about is "AMPS" and "how you git mo watts". So over time, Dick's
curriculum has become rather limited. Too bad.

Not that it matters to you, but if you can measure something, you
should be able to detect it, too. Don't ya think? But all that is
irrelevant....

>Were you jerking all those people's chains on r.r.a.a when they showed you
>your error yet you continued to claim you could measure SWR with a DC
>voltmeter?

By golly, I think you finally figured it out! Yes, I was jerking their
chains! And now I'm laughing my head off because you are too stupid to
see that, and after all this time you are still taking the whole thing
seriously! Go back and read the thread in rraa again and you will be
able to tell when I got fed up with the idiotic comments and started
being sarcastic. The problem is that you so obsessed with me that you
are blinded to things that are obvious even to the most casual
observer, such as the ridulousness of measuring SWR with a DC
voltmeter. If you think that is just an excuse, do you remember my
idea to build a spark-gap transmitter? Or a megawatt amp? Or how I
kept you going on that Dwight Stewart fiasco?

And just like I told Brainbuster the other day, it doesn't matter now
what I say now, because you have your mind made up regardless of the
facts, and you will continue to entertain us with your obsession for a
very long time! So now I plan to sit back and watch you continue to
spam the newsgroup with your obsessive rants. I wonder if the
anti-spam freaks are going to start complaining like they do about
Voobner...

How do you equate illegal operation with CB radio? Just how do 1000
watt amps fall within the 4 watt limitation? How does 27.555 MHz fall
between 26.96 and 27.41 MHz? Is that the "new math"?

>Have fun living in your own dream.

I live in my reality as I influence it with my dreams. Ever watch
South Pacific? But thanks for the nice thoughts anyway.

No, you need to pay attention to them. Your idea that you can measure SWR with a DC voltmeter is just B.S. You know it by now and you cannot figure how to back out of it without admitting your are totally wrong. You tried to revise what you had said from the very beginning.

Where in all those textbooks that you have listed on your web page is your nutty idea supported? Cite one reference. You can't can you Frank? I'd bet all the authors of those textbooks would laugh at your SWR DC meter debacle too.

What's wrong Frank? Was the math too much for you? Or did you finally
realize that no amount of your B.S. will get you out of your latest
technical fiasco?

Quit avoiding the question.

If you can read SWR with a DC voltmeter then there must be a DC component to
the standing waves of voltage and current. How do you explain the DC
component that results from the superposition of two AC waves? I showed you
the math that demonstrates the standing wave is AC with no DC component. I
have even provided a link to a website that explains this in terms even a
high school physics student can understand. That you don't understand this
say a lot about your technical competence.

Ok then Frank, explain what I missed by not paying attention. Explain how
any of those responses support your idea that you can measure SWR directly
with a DC voltmeter.

I am glad that you mentioned backpeddling because that is exactly what you are doing Frank Aaron. You started backpeddling when you tried to say you can "detect" instead of "measure". LOL!

Were you jerking all those people's chains on r.r.a.a when they showed you your error yet you continued to claim you could measure SWR with a DC voltmeter?

BTW, it backpedaling.

Frothing at the mouth? LOL! Backpeddling (sic) Frank Aaron I am laughing at you. I'm laughing at your technical incompetence just like you were laughed off of r.r.a.a for your nutty theories.

Our resident illegal-CB-activist and diode-snipper Mr. TRAIN of
Boonton, NJ will be with you shortly. In the meantime may I comment
that any modification to a type-accepted CB radio is illegal. Also the
use of "upper and lower frequencies" is illegal, since they belong to
services other than CB that are licensed to operate in that part of
the radio spectrum.

> work?tnx

Short the relay lines together then measure across the short, you will get 0 ohms. [OK, kidding...I'M KIDDING, calm down Phil]. Seriously though, why do you need to use an illegal amplifier? Why bootleg with ham gear? Oh I forgot, you're posting in REC.RADIO.CB so, Mr. "IDXeleven", I have been reminded that we must give you the benefit of the doubt and assume you are A HAM who intends to use the FT100 and the amplifier LEGALLY on ham bands only and with the proper class of license. And the reason you're asking this question in A CB NEWSGROUP and not asking this question in a ham newsgroup is because _____(add excuse here)_____. OK, it's all clear to me now. Anyway, one of our resident illegal-CB-activists will be assisting you shortly.

> thinking that the reflected power is lower than it actually is, to the
> benefit of the antenna manufacturers.

It is not true that an SWR meter will read lower than the true value at
a current minimum. Why would it?

An SWR meter is a directional power meter. The power along the line
is constant at all points (neglecting minor losses). Furthermore, an
SWR meter does not merely measure voltage (or current). It would
not exhibit any directivity if it did. It measures power by
simultaneously sampling voltage and current. Even the cheap meters
do this; there is nothing sophisticated about doing this.

While the coax length can change the input impedance, it does not
change the SWR.

By the way, who says the impedance of CB antennas is typically lower
than 50 ohms? I would call this an assumption. I tuned my antenna to
a virtually perfect match in the middle of the band. The SWR goes up
on each end of the band. Do you think my impedance is below 50 ohms
on channel 1 AND below 50 ohms on channel 40? I would venture to
guess that it is above 50 ohms on one end of the band and below 50 ohms
on the other end of the band.

The answer was incorrect. See my response.

My antenna manufacturer got it right. I can tune it to an
excellent match in the middle of the band. I don't see any
need to change anything. What's wrong with your antenna?

No preference here, but I tend to go along with Frank's statement. For
the most part, the truckers and casual users call it CB radio and the
hobbyists call it 11-meters. You say to-may-toe and I say to-mah-toe,
no biggie.

Nah, just about right.

BTW, how's that Jenny Craig thing going? Lost any, or are just going broke
buying the meals?

495. Dinner at Aaron's

Newsgroup: rec.radio.cb
Date: 2002-06-05 10:52:35 UTC
From: dweebospanka@aol.com
Message-ID: <20020605065235.04527.00000500@mb-mv.aol.com>

(Knock at the door) Aaron opens door wearing his skimpiest thong underwear

Aaron: Hi Sparky! How are you!

Sparky: I'm good Aaron. Is dinner ready?

Aaron: Almost. In the meantime, you can snack on me, but we need to hurry before George gets here.

Sparky:(screaming) Aaron! Will you shut up with the advances! I already told you I've started to like women now! Now leave me alone!

Aaron: OK, OK! I just thought we could be like the old days again.

Sparky: No, I'm really going to stick it out this time.

Aaron: (sniffling) Ok Sparky, have it your way. I'll respect your wishes.

Sparky: Where's George? Do we have to wait for him to eat?

Aaron: Yes, he's bringing the salad.

Sparky: OK. Got any snacks?

Aaron: I think so, let me check.

(knock at the door)Aaron answers the door.

Aaron:(exclaiming) George! My God! What happened to you?

George:(crying) I was just out minding my own business, following this little girl, and all the sudden, wham! Her Dad must have seen me and punched me. I had just asked if she wanted some candy too. I think I could have had her. Then the Dad pulled out of the window of my Pacer, and beat me some more. I think he dislocated my shoulder too.

Sparky: Can we eat now?

Aaron: Sparky, can't you see George is hurt? Go get one of the steaks for George's black eyes. And while you're in the kitchen Sparky, get some ice for his broken nose and busted lip too.

Sparky: OK, but I ain't eating the steak that you use on George's eyes!

Aaron: OK, whatever!

(Sparky spends fully 5 minutes trying to figure out which steak is the smallest, so he can have the biggest…then finally he returns)

Aaron: God Sparky! Why did you take a bite out of it? It's raw, for Christ's sake!

Sparky:(unintelligible mumbling caused by mouthful of raw steak)

Aaron:(grabs steak from Sparky and applies it to George's eyes) There now George. Is that better? Aaron knows how to make you feel better, doesn't he?

George: Yes Aaron, it's much better now. Thanks, you know I bruise easily.

Aaron: Hey Sparky, light the grill.

Sparky: Hey, those steaks ain't half bad raw! Do we really need to cook them?

Aaron: My God Sparky! Sometimes you act like a Neanderthal! Light the damn grill!

(Sparky goes out back, turns on the gas, clicks the igniter repeatedly, nothing happens. Goes back inside for matches and returns)

Aaron:(just as Sparky lights the match) NO! STOP!

(loud explosion)

Sparky: (screaming) I'm on fire! Somebody help me!

(Sparky runs back through the house with his beard on fire, screaming for help. Aaron and George race behind him with teacups filled with water)

Finally, Aaron and George manage to catch Sparky and beat out the fire in Sparky's beard with the teacups.

Sparky: Thanks guys! That was close! I saw my life flash before my eyes.

Aaron: No prob Sparky. You know we love you.

George: Speak for yourself, Aaron! Faggot!

Sparky: Can we eat now?

George: Well, we could if you hadn't blown up the grill!

Aaron: It's OK Sparky. We'll just grill the steaks on the stove.

Sparky: I don't wanna wait! I'm getting dizzy. My cholesterol must have dropped below 300.

George: Here, drink this.

Sparky: What is it?

George: Bacon drippings. It will bring the cholesterol level back up in your blood.

Sparky:(drinks greedily) Burp! Thanks George.

George: No problem. Hey Aaron, you still have that "Little Girls Gone Wild" video?

Aaron: I think so…check over there in the gay porn by the VCR.

George: Faggot! (looks for the tape)

Sparky: I'm hungry! Let's eat.

Aaron: Just hang on a minute. Let me get these damn steaks cooked. (throws the steaks in the pan)

George: (tearing his eyes off the video) Sparky, get the salad and dressing ready, will ya? I'm busy now.

Sparky: OK, George. (Sparky sets the table)

Aaron: How do you guys like your steaks?

Sparky: Raw is fine with me.

George: (rubbing his crotch while watching the little girl video) I don't care. Yeah, raw is fine with me too.

Aaron: (mumbles) Damn weirdo's…

Aaron: (grease splatters on Aaron's hairless chest) Ouch!

George: Aaron, do you mind if I take this video home with me?

Aaron: Sure, take it. You know I don't like females.

George: (under his breath) Faggot!

Sparky: Can we eat now?

Aaron: Yep! Steaks are done. (Aaron places them on the table)

Sparky: I'm first George! That's my steak!

George: Whatever Sparky! Hell, I'm just gonna leave now. (grabs the video and heads for the door)

Aaron: Where you going, George?

George: Um…uh…I'm not really hungry now. I think I'll just watch this tape at home.

Sparky: Good! Gimme his steak.

Aaron: OK George, see ya later.

George: Bye

Scene: Much later in the evening after George has gone home to watch his kiddie porn, we return to find Aaron and Sparky enmeshed in each other's arms.

Aaron: Sparky, I knew you would come around.

Sparky: Well Aaron, I kind of feel guilty…almost as if I'm slipping back into my old self. I've really tried to kick this man habit, but I can't seem to stop having feelings for you.

Aaron: Well Sparky, I always knew we were meant for each other.

Sparky: I only ask one thing of you, Aaron.

Aaron: What might that be, Sparky?

Sparky: All I ask is that you don't breath a word of this encounter to George.

Aaron: Fair enough. I know he's a bit of a bigot.

Sparky: Yes he is, but he's still my only real friend. You know, I can't count the times that he's tried to save me when I've gotten in over my head on the newsgroup.

Aaron: I know Sparky, and he's done the same for me. I really love him, but I can't let him know that.

Sparky: So, we're sworn to secrecy, right Aaron?

Aaron: Absolutely! Remember, we did take the AKC pledge.

Sparky:(chuckles quietly)

Sparky: (tentatively) OK Aaron, I'm all yours.

Scene: Fade to black…

As I see it it, and I agree that it might be a case of picking nits, 11 meters is a much larger chunk of spectrum, that the legal 40 CB channels fit into. If we're talking about legal operation, I like to refer to it as "CB", since that is the official name of the service.

Once you start talking about freebanding, it is no longer a legal "CB" activity, and therefore is not technically "CB radio". So I use the term "11 meters" to describe operations that extend beyond the legal 40.

YMMV

I am glad you finally realized that you are technically incompetent. You took the easy way out (and the way that I expected you to take) by claiming your were just jerking people's chains. How pitiful. The "ridulousness" of it!

> If you think that is just an excuse, do you remember my
> idea to build a spark-gap transmitter? Or a megawatt amp? Or how I
> kept you going on that Dwight Stewart fiasco?

Sounds like you are obsessed with something or someone. Did you forget to take your medicine again? I might do a search to see what you are referring to above for some laughs.

> And just like I told Brainbuster the other day, it doesn't matter now
> what I say now, because you have your mind made up regardless of the
> facts, and you will continue to entertain us with your obsession for a

My mind is made up that you are technically ignorant in some areas. I am glad that I was able to educate you. It shows that there may be some hope for you after all. Too bad your ego won't let you just admit you were wrong instead of backpedaling here for all to see.

> So now I plan to sit back and watch you continue to

The "jumper" is a permanent thing. You will either need to solder bridge the two pads, or solder a very small piece of wire across the two. AFTER this is done, you can short out the capacitor, or if you like, you can leave the batteries out of the unit for about 24-hours. That should be sufficient time for the unit to drain the capacitor on its own.

As Aaron pointed out, the modification is illegal, but that doesn't stop most people.

The only way to reverse this is to remove the jumper and reset the radio again. There is no way of switching back and forth between the 40 channels and the 120 channels.

Also note, that by doing this, you slow down the units scanning ability, as it must now scan 120 channels instead of 40.

There are a couple of other little tidbits I found with these units, one would be FM mode, instead of AM (It only says FM, but still transmits AM), and the other would be Broadcast FM mode. (i.e. 88.5 to 107.9). They show up in the display area, however they are non-functional features.

PH

505. Why Frank "Sparky" Aaron hides out in rec.radio.cb

Newsgroup: rec.radio.cb
Date: 2002-06-05 13:32:25 UTC
From: jicon_101 <jicon_101@yahoo.com>
Message-ID: <JpoL8.13514$zh2.6871268@twister.neo.rr.com>
Source record: 126459

Was Frank "Sparky" Aaron jerking people's chains when he wrote the
following?

How Can A Coax Radiate?

A coax works correctly when all of the RF power is contained within the
shield. When standing waves are present, the resulting fluctuation of signal
impedance creates a problem, because the signal departs from the
characteristic impedance of the coax. If the coax is only designed to work
with signals of 50 ohms impedance, but the signal is not 50 ohms, or if it
fluctuates as it does in the presence of standing waves, the coax will not
work correctly. If the coax does not work correctly, for whatever reason,
the RF containment fails, and the outside of the shield will begin to
conduct RF, which then radiates. So when the antenna is not matched to the
coax, the coax radiates. This can be easily tested with a field strength
meter, which shows this to be the case. Radiating coax is not desireable
unless it is intentional.

How about it Frank, do you actually believe what you wrote above or is it
more chain jerking?

Check it out at: http://www.cet.com/~sparky/cb15.htm

Some questions about the Cobra 45WX mod which adds the upper and lower
frequencies. When making the modification how are the "jumpers" applied?
Is this a piece of wire that is soldered on? I read one posting which
indicated that this was just a wire (like test leads) temporarily placed
between the two contact points? Does the jumper have to be place when
the C506 is jumpered to reset the unit? How is the modification
reversed? Also, is this a legal or illegal modification?
Thanks

>Our resident illegal-CB-activist and diode-snipper Mr. TRAIN of
Boonton, NJ will be with you shortly. In the meantime may I comment that
any modification to a type-accepted CB radio is illegal. Also the use of
"upper and lower frequencies" is illegal, since they belong to services
other than CB that are licensed to operate in that part of the radio
spectrum.
-Aaron- <<

Certainly. I will add the usual disclaimer to your intimidation tactics.
Talking on the freeband, while technically illegal, is for the large
part, ignored by the FCC. Most of the services assigned to those
frequencies have long abandoned them in favor of up-to-date
communications. The DX is killer on the freeband and no extra power is
usually needed. It is not like anyone will be alone on the freeband, as
there are thousands and thousands worldwide that use it on a daily
basis. I have been freebanding since the early seventies on almost a
daily basis with no problems, complaints, fcc or federal marshals
slamming me with a fine, as have the rest of the fine folks you will
find there. Run a clean station and do what the hammies try to do at a
fraction of the cost, if that's your bag. Be courteous on the air and
you will enjoy many years of making great contacts worldwide. Enjoy.

hey Parks, you are exactly right thats why i corrected jicon. he was wrong on 2 occasions. Now I would like to prove you wrong ... For a price that is What do you say. You cut 12 million acres of sod right you should have a few extra bucks in your pocket what do you say. Stand to lose some money asshole? I am thinking along the lines of say $5,000 for starters to prove you wrong. Or do you just like talking shit all the time.

Sparky, I will show them how to work a killfile.
Not your in my kill file but ill reply to you anyhow as a few of our
illustious posters have done.
No when your killfiled your killfiled, and that drunken fool is killfiled.

True story, although I should probably edit it a little bit better
when I update my site.

>Check it out at: http://www.cet.com/~sparky/cb15.htm

Very good, Phil. You found the page! Now where does it say that you
can measure SWR with a DC voltmeter? It doesn't, and it never did. Did
you read the part about how the SWR meter works because of an
induction pickup? How can you have induction with DC? You can't. The
idea of measuring SWR as DC is so ludicrous that I didn't think anyone
would take it seriously. Evidently I was wrong, there really was
someone that stupid -- you!

Profiling...

To ensure we Americans never offend anyone - particularly fanatics intent on killing us - airport screeners will not be allowed to profile people. They will continue random searches of 80-year-old women, little kids, airline pilots with proper identification, Secret
Service agents who are members of the President's security detail, 85-year old Congressmen with metal hips, and Medal of Honor winning former Governors. Let's pause a moment and take the following test.

In 1972 at the Munich Olympics, athletes were kidnapped and massacred by:
(a) Olga Corbutt
(b) Sitting Bull
(c) Arnold Schwartzeneger
(d) Muslim male extremists mostly between the ages of 17 and 40.

In 1979,the U.S. embassy in Iran was taken over by:
(a) Lost Norwegians
(b) Elvis
(c) A tour bus full of 80-year-old women
(d) Muslim male extremists mostly between the ages of 17 and 40.

During the 1980's a number of Americans were kidnapped in Lebanon by:
(a) John Dillinger
(b) T
he King of Sweden
(c) The Boy Scouts
(d) Muslim male extremists mostly between the ages of 17 and 40.

In 1983, the U.S. Marine barracks in Beirut was blown up by:
(a) A pizza delivery boy
(b) Pee Wee Herman
(c) Geraldo Rivera making up for a slow news day
(d) Muslim male extremists mostly between the ages of 17 and 40.

In 1985 the cruise ship Achille Lauro was hijacked, and a 70 year old American passenger was murdered and thrown overboard by:
(a) The Smurfs
(b) Davy Jones
(c) The Little Mermaid
(d) Muslim male extremists mostly between the ages of 17 and 40.

In 1985 TWA flight 847 was hijacked at Athens, and a U.S. Navy diver was murdered by:
(a) Captain Kid
(b) Charles Lindberg

(c) Mother Teresa
(d) Muslim male extremists mostly between the ages of 17 and 40.

In 1988, Pan Am Flight 103 was bombed by:
(a) Scooby Doo
(b) The Tooth Fairy

Yesterday.....

Back in the early 80's I assisted Bob Heil (K9EID) when he was developing the HC3
mic element. We were 80 miles apart in Southern Illinois and tested the HC3 element
on the 220 mHz FM band. It was a perfect Go-No Go test. His signal was unreadable
using any mic but the HC3 element. That model is discontinued now, or was. I kept several elements for some time. You might note that the impedance of Heil mics is 2K ohms and most closely matches the input of a class a audio amp.

>Unbalanced currents in a feedline causes it to radiate.

In case you haven't noticed, a coax is an unbalanced transmission
line.

> A choke balun made
>with ferrite material can reduce the imbalance by reducing the currents
>traveling on the outside of coax braid. It basically inductively loads the
>outside braid of the coax and chokes off the current there.

That's one way to do it, but it has drawbacks. The choke can be a
source of high impedance to the RF, and therefore resisting the RF
currents. OTOH, if the impedance isn't very high, it could just absorb
the RF and reradiate it back onto the coax. Either way the result is
the same, as part of the signal (the signal on the outside of the
coax) is reflected back to the source, just like a transmission line.
Then you have iterations upon iterations of signals and reflections.

Also, unless you put many chokes along the shield spaced less than a
resonant distance apart, unchoked sections of the coax might radiate
regardless of the choke at the end of the coax.

Matching the antenna to the feedline is a much better method.

>SWR on a transmission line does not cause unbalanced currents in the two
>conductors.

It does if the incident RF is unbalanced. But I don't see what that has to do with the discussion.

> The coax will not radiate more RF with a high SWR as he claims.
>To prove this terminate your 50 ohm coax with a 100 ohm resistor. This
>causes SWR on the coax. Even though there is a standing wave on the coax
>the currents in the center conductor and shield are balanced. There is no
>more radiation that if the coax was terminated with a 50 ohm resistor. You
>can further verify this by taking field strength measurements in both cases
>(50 ohm and 100 loads). I used to test coax.

If you had then you would have seen coax radiating on a mismatch. And it has nothing to do with the balance of the conductors, it has to do with the impedance of the standing wave being different than the impedance of the transmission line. Or wasn't that explained clearly enough for you?

I don't call it "backpedaling". I call it a torch that I can hold high
for everyone to see how people like you and those idiots in rraa will
take a simple typing mistake and turn it into prima facie of their
metal superiority. But when faced with a simple little technical
problem that they can't answer (my favorite example is the 6:1 balun)
they squirm and twist all over the place. Do you really think I care
what you or any of those super-ego hams think? Of course not! But I
can sure play their own game right back in their face!

Like I said before, if you want to see something funny, post this
simple question to all those newsgroups you spammed in your quest for
intellectual satisfaction: "How do you wind a 6:1 balun"? In fact,
since you think you are so technically superior, answer it yourself!
Yeah, answering that EASY question might just be a good idea, because
your constant begging is getting really boring.

Frank you are a liar.

This is what your web page said before you revised it:

What Is SWR?

The interaction between the forward and reflected signals along the coax creates points of high voltage and low current, as well as points of low voltage and high current. These points are part of the standing wave that results from RF power being reflected back down the coax. The standing wave is called 'standing' because those points of high voltage and high current do not move, and the voltage can actually be measured with a simple DC voltmeter. The ratio between forward power and reflected power is called the standing wave ratio, or SWR. The higher the SWR, the more power that is reflected back into the transmitter. (More accurately, this is called the Voltage Standing Wave Ratio, or VSWR, and is the ratio of the maximum voltage to the minimum voltage along the standing wave.)

As stated before, the reflected power is sent back through the coax, where part of it is radiated from the coax as RF energy, and part of it is dissipated as heat in the transmitter. (Some of it can also be re-reflected back to the antenna, but this usually only happens when there is a transmitter/coax mismatch.) If this reflected power is strong enough, it can damage parts inside the transmitter. Some transmitter components can handle large amounts of reflected power, but others may be easily damaged. So it is best to reduce the reflected power to a minimum not only for the sake of the transmitter, but also, as stated above, to improve the efficiency of the antenna.

This is the response it got:

From: richardharrison@webtv.net (Richard Harrison)
Newsgroups: rec.radio.amateur.antenna
Subject: Re: Beginner's Guide to Impedance Matching
Date: Tue, 24 Jul 2001 08:02:02 -0500 (CDT)

Good!

I admire the style, but the mistakes, and there are several, need correction. It is eloquent but several assertions are wrong. For example, you need more than a simple d-c voltmeter to measure SWR. Other statements are close to the truth, but the miss is as good as a mile. I have no interest in trying to correct the errors. I am not a technical writer nor a teacher, and I did like the simplified approach until it went astray.

Best regards, Richard Harrison, KB5WZI

Compare the original text below to http://www.cet.com/~sparky/cb15.htm
where he made revisions after getting his butt spanked in r.r.a.a.

Frank said he never mentioned measuring SWR with a DC voltmeter. The
following proves that he is a liar (and is now embarrassed by what he
wrote). More backpedaling by Frank "Sparky" Aaron.

Impedance matching is the necessary step to getting the most from your radio
station. Impedance matching is most important in the use of transmitters, so
this page will use a transmitter application. However, keep in mind that by
improving the station for transmitting you will also improve it's receive
performance -- there is little difference where RF is concerned.

Some Basics... (please read for terminology)
The typical radio station is made up of three components: The transmitter;
the transmission line; and the antenna. The transmitter generates the RF
signal to be transmitted, the transmission line carries this signal to the
antenna, and the antenna pumps the RF power into space in the form of radio
waves.

Each of these components has an impedance. Simply stated, impedance is
resistance to electricity. There is a close relationship between impedance
and the two other components of electricity, voltage and current. This
relationship is shown by Ohm's Law:

E = I * Z

where
E = electromotive force, or voltage, and is measured in volts.
I = current, and is measured in amperes.
Z = impedance, and is measured in ohms.

Because of this relationship, the term 'impedance' is often used to describe
the ratio of voltage to current. So a signal with an impedance of 10 ohms
will show 10 volts for every ampere of current.

The transmitter will have a source impedance, which means that the
transmitter works most efficiently when the signal has the voltage to
current ratio equal to this source impedance. Almost all CB radios have a
source impedance of 50 ohms. Since a CB radio is limited to 4 watts, and
since power (watts) equals voltage multiplied by current, we can then deduce
the following:

Power = 4 watts = E * I
And from Ohm's law;

Impedance = 50 ohms = E / I
Therefore;

I = 0.283 amperes, and
E = 14.14 volts

The transmission line will have a characteristic impedance. This means that the transmission line is most efficient when the signal being transmitted through it is equal to the line's characteristic impedance. The most popular type of transmission line is coaxial cable, or coax for short. Most video and television lines are coax with a 75 ohm characteristic impedance, and CB radio typically uses 50 ohm coax.

Likewise, the antenna will have a load impedance. Again, this is the voltage-to-current ratio at which the antenna operates most efficiently. Different antennas will have different load impedance's. For example, a simple dipole has a load impedance of 73 ohms, but that can vary quite a bit according to where the antenna is located. A vertical 1/4 wave whip is ideally 36.5 ohms, but again that changes considerably with the type of ground plane used. While the transmitter and transmission line usually have impedance's that are constant regardless of other factors, the impedance of the antenna can be unpredictable.

A radio station using these three components has two important connections: The connection between the transmitter and the transmission line; and the connection between the transmission line and the antenna. Each connection has two parts -- a source and a load. In the first connection, the transmitter is the source and the transmission line is the load, because the signal is moving from the transmitter to the transmission line. The second connection matches the transmission line -- which now becomes the source because that's where the signal is coming from -- to the antenna, which is the load. So the transmission line functions as both a load and as a source, depending upon which end is being considered.

What Is A Mismatch?
From now on, transmission line will be called coax.

The most efficient transfer of power from one component to another (transmitter to coax, coax to antenna) occurs when the source impedance is equal to the load impedance. In the case of CB radio, the first connection is rarely a problem, as the transmitter is usually 50 ohms (source) and the coax that is normally used is also 50 ohms (load). But the second connection poses a problem. While the coax is fixed at 50 ohms (now a source), the antenna may or may not be a load of 50 ohms. It usually isn't.

A mismatch occurs when the impedance's of the source and the load are not equal. If the load does not match the source, the load will not absorb all of the forward power (power that is sent from the transmitter to the antenna), and what is not absorbed is reflected back to the source, which, in this case, is the coax. The coax takes the reflected power and does what it does best -- it sends it to the other end of the coax and right back into the transmitter. This can be a problem for two reasons: First, some of the power is not going out the antenna, which is where it should be going;

Second, if this reflected power is excessive it can destroy parts in the transmitter.

What Is SWR?
The interaction between the forward and reflected signals along the coax creates points of high voltage and low current, as well as points of low voltage and high current. These points are part of the standing wave that results from RF power being reflected back down the coax. The standing wave is called 'standing' because those points of high voltage and high current do not move, and the voltage can actually be measured with a simple DC voltmeter. The ratio between forward power and reflected power is called the standing wave ratio, or SWR. The higher the SWR, the more power that is reflected back into the transmitter. (More accurately, this is called the Voltage Standing Wave Ratio, or VSWR, and is the ratio of the maximum voltage to the minimum voltage along the standing wave.)

As stated before, the reflected power is sent back through the coax, where part of it is radiated from the coax as RF energy, and part of it is dissipated as heat in the transmitter. (Some of it can also be re-reflected back to the antenna, but this usually only happens when there is a transmitter/coax mismatch.) If this reflected power is strong enough, it can damage parts inside the transmitter. Some transmitter components can handle large amounts of reflected power, but others may be easily damaged. So it is best to reduce the reflected power to a minimum not only for the sake of the transmitter, but also, as stated above, to improve the efficiency of the antenna.

How Do I Measure Reflected Power?
There are two common methods to measure reflected power. The first is to use a meter that will measure reflected power directly, which is nothing more than a forward power meter connected backwards. The second and most popular method is to use a device that measures the SWR directly by integrating the two meters into one. This meter is called, not suprisingly, a SWR meter.

How Do Power Meters Work?
An inductive pickup wire is placed very close, and parallel to, the center conductor of the coax. The signal from this pickup wire is rectified, filtered, and sent to a meter. If the signal is rectified in one direction the meter will read forward power, and if the signal is rectified in the opposite direction the meter will read reflected power. It's that simple.

How Do I Use The Power Meter?
First, forward power is measured by disconnecting the antenna and sending the RF signal into a dummy load which has the same impedance as the coax. Since the impedance's are equal, there will be no mismatch, and therefore no power will be reflected. Then the antenna is reconnected, and you can either measure reflected power directly with a power meter, or use an SWR meter to measure the standing wave ratio. Usually it is not necessary to know both reflected power and SWR.

Where Should I Measure SWR?
Every standing wave begins at the point of mismatch, and continues along the

transmission line back to the source. With all standing waves, any point of maximum voltage is also a point of minimum current, and vice-versa. And with all standing waves, the voltage and current reverse their maximum and minimum points every quarter wavelength beginning at the point of mismatch. So whenever a standing wave creates a point of maximum voltage on a transmission line (point A), it will also be a point of minimum current. One quarter wavelength away on the transmission line (point B) there will be a point of minimum voltage and maximum current. Moving down the transmission line one more quarter wavelength (point C, or one half wavelength from point A) will again show a point of maximum voltage and minimum current, just like point A.

There are two different types of standing waves, and the only difference between them is the phase. When there is a mismatch where the antenna impedance is higher than that of the coax, the standing wave begins at the point of mismatch with maximum voltage and minimum current. Conversely, when the antenna impedance is lower than the coax, the standing wave begins with minimum voltage and maximum current.

The result is best described with an example: If the coax is 50 ohms and the antenna is 150 ohms, then the impedance of the signal at the point of mismatch will be 150 ohms, and it will also be 150 ohms at every half-wavelength back to the transmitter (1/2, 1, 1-1/2, etc). But at a point one-quarter wavelength back from the antenna the impedance of the signal is only 16.7 ohms, and it will be 16.7 ohms every half-wavelength from that point back to the transmitter (1/4, 3/4, 1-1/4, etc).

Now remember that the power meter works from an inductive pickup wire, which means the meter is actually picking up the signal's current from the transmission line. When a standing wave is present, the meter will be reading the current from the forward power, but it will also be reading the current from the standing wave. The current from the standing wave may be large or small, depending upon where the meter is located along the standing wave, i.e, along the coax.

So in a nutshell: When the standing wave current is low the SWR meter will show less than true reflected power, and when the current is high the meter will read high. (There is also a negative effect on the meter caused from an impedance mismatch between the coax and the meter's pickup section, but this effect is usually small enough to ignore). Because a standing wave creates such a wide variation of current along the coax, the best place to measure SWR is at the point of mismatch -- the connection between the coax and antenna -- where the phase relationships between the forward and reflected signals will always be the same. This is assuming, of course, that your transmitter and coax are already properly matched.

It is important to note that SWR does not vary at all along the coax, and neither does forward and reflected power. What changes is the observed SWR, which is a limitation in the design of the meter.

All this can be proven by doing a very simple CB experiment. Take two runs of coax that are about 3 feet different in length. Select one and connect it

to a transmitter (of the same impedance) and to an antenna or dummy load that is not the same impedance, so you intentionally create a mismatch at the coax/antenna connection. Test the SWR at the transmitter/coax connection and again at the coax/antenna connection. Then replace the coax with the longer (or shorter) run and repeat both measurements. The SWR at the coax/antenna connection will be the same for the two different lengths of coax, but the SWR at the transmitter/coax connection will be noticeably different. This experiment assumes that everything else is the same for both lengths of coax, and everything works properly.

Why Does Everyone Say I Need 18 Feet of Coax?
One common deception among CB antenna manufacturers is by them using the standing wave to their advantage. The impedance of CB antennas is typically lower than 50 ohms, which means that the current of the standing wave will be at it's maximum at the point of mismatch. But at one-quarter wavelength away from the antenna, and every half-wavelength thereafter, the current is at it's minimum. At these points a SWR meter will read lower than true value s, making the antenna appear to perform better than it actually does. Now, using the standard 50 ohm coax with a velocity factor of 66%, three-quarters of a wavelength is equivalent to 18 feet. This is the length of coax recommended by so many of the CB antenna manufacturers. Using this length of coax will effectively 'fool' any SWR meter located at the transmitter into thinking that the reflected power is lower than it actually is, to the benefit of the antenna manufacturers.

How Can A Coax Radiate?
A coax cable works correctly when all of the RF power is contained within the shield. When standing waves are present, the resulting fluctuation of signal impedance creates a problem, because the signal departs from the characteristic impedance of the coax. If the coax is only designed to work with signals of 50 ohms impedance, but the signal is not 50 ohms, or fluctuates as it does in the presence of standing waves, the coax will not work correctly. If the coax does not work correctly, for whatever reason, the RF containment fails, and the shield will begin to conduct RF. So when the antenna is not matched to the coax, the coax radiates. This can be easily tested with a field strength meter, which shows this to be the case. Radiating coax is not desireable unless it is intentional.

What Are Common-Mode Currents?
Common-mode currents are currents that run in the same direction and in phase on both the center conductor and the shield of the coax. This creates a condition called 'floating', and is usually an indication of an inadequate ground at one or both ends of the transmission line. Common-mode currents will also occur if the coax run is very long and not well grounded along the run. Regardless, common-mode currents are not the cause of a problem, but the symptom of a problem caused by something else.

What Is A Conjugate Match?
By definition, a 'conjugate match' is a type of impedance match where one component is matched to the collective impedance -- or 'conjugate impedance' -- of two or more components. Typically, a conjugate match

ignores any coax/antenna mismatch and performs all impedance matching at the transmitter/coax connection, disregarding the characteristic impedance of the coax. In this case the coax radiates RF and becomes an intentional part of the antenna system. There are other types of conjugate matching, but this is the most common type associated with CB radio, intentional or not.

What Is Ground?
The most common definition of 'ground' is: a point of very low impedance, the lower the better. This can be a DC, AC or RF ground, the only difference being the frequency. A good DC ground may not be a good ground at 27MHz, because while it has low impedance at DC, it may have a very high impedance at higher frequencies.

When discussing antennas, the term 'ground plane' is often used. This is the part of an antenna system that has a very low impedance to the design frequency of the antenna. More specifically, it is an antenna component that is tuned for the lowest impedance possible at a specific frequency. For example, the multiple elements that make up the ground plane on an elevated ground plane antenna create a low-impedance point for terminating the shield of the coax, but the impedance is lowest only at a frequency that is determined by the length of the elements.

What Is A Counterpoise?
The best analogy for a counterpoise would be a ship that pushes against the water with it's propellers to give it forward motion. The water is the counterpoise, because if there is no water to push against, the ship isn't going anywhere. Likewise, an antenna must have a counterpoise to 'push against'. This can be a ground plane (as stated above), or it can be half of a radiating element working in opposite phase to the other half like a see-saw (example: Hertzian dipole). The Earth itself can even act as a counterpoise under the right conditions, and coax shielding is sometimes used as a counterpoise.

What Is SWR?

The interaction between the forward and reflected signals along the coax creates points of high voltage and low current, as well as points of low voltage and high current. These points are part of the standing wave that results from RF power being reflected back down the coax. The standing wave is called 'standing' because those points of high voltage and high current do not move, and the voltage can actually be measured with a simple DC voltmeter. The ratio between forward power and reflected power is called the standing wave ratio, or SWR. The higher the SWR, the more power that is reflected back into the transmitter. (More accurately, this is called the Voltage Standing Wave Ratio, or VSWR, and is the ratio of the maximum voltage to the minimum voltage along the standing wave.)

As stated before, the reflected power is sent back through the coax, where part of it is radiated from the coax as RF energy, and part of it is dissipated as heat in the transmitter. (Some of it can also be re-reflected back to the antenna, but this usually only happens when there is a transmitter/coax mismatch.) If this reflected power is strong enough, it can damage parts inside the transmitter. Some transmitter components can handle large amounts of reflected power, but others may be easily damaged. So it is best to reduce the reflected power to a minimum not only for the sake of the transmitter, but also, as stated above, to improve the efficiency of the antenna.

Not for nothing, James...there are commercially produced products
designed specifically to combat feedline radiation. They're called
line-isolators or ununs. (UNbalanced to UNbalanced as opposed to a
balun, which is BALanced to UNbalanced.) There is also a very popular
antenna that takes advantage of a short length of radiating coax, that
is to say it's intentional. It's called the Carolina Windom. I'll
provide the links below.

http://www.radioworks.com/index2.html

Just navigate via the buttons to the Carolina Windom and the
line-isolators. I personally don't like the idea of my feedline
radiating so when it came down to a choice between the CW80 and the
tried and true 80-meter doublet, I went with the doublet fed with
ladder-line and a 4:1 current balun...and yes, I use a grounded line
isolator to keep any stray rf out of the shack. (Many an upper lip

have been zapped via the combination of stray rf and a D-104 head.)
Hope you take this info in the sprit in which it's given, no flames
intended. Take it easy.

<snip>

What Is SWR?
The interaction between the forward and reflected signals along the coax
creates points of high voltage and low current, as well as points of low
voltage and high current. These points are part of the standing wave that
results from RF power being reflected back down the coax. The standing wave
is called 'standing' because those points of high voltage and high current
do not move, and the voltage can actually be measured with a simple DC
voltmeter. The ratio between forward power and reflected power is called the
standing wave ratio, or SWR. The higher the SWR, the more power that is
reflected back into the transmitter. (More accurately, this is called the
Voltage Standing Wave Ratio, or VSWR, and is the ratio of the maximum
voltage to the minimum voltage along the standing wave.)

As stated before, the reflected power is sent back through the coax, where
part of it is radiated from the coax as RF energy, and part of it is
dissipated as heat in the transmitter. (Some of it can also be re-reflected
back to the antenna, but this usually only happens when there is a
transmitter/coax mismatch.) If this reflected power is strong enough, it can
damage parts inside the transmitter. Some transmitter components can handle
large amounts of reflected power, but others may be easily damaged. So it is
best to reduce the reflected power to a minimum not only for the sake of the
transmitter, but also, as stated above, to improve the efficiency of the
antenna.

Actually, no you don't. SWR is the ratio of Vmax to Vmin on the
standing wave. The wave doesn't move (standing?) and can be measured
as a DC potential. It's easier to measure on twin-lead since you don't
have to poke through the shield, but you can indeed measure SWR with a
DC voltmeter.

Instead of spewing your preconceived opinions on what's possible and
impossible, take the time to consider the possiblity that -just maybe-
someone might know something you don't. Then, after you put your ego
to bed for the night, go test it just like I did in EM lab many years
ago. I would suggest a VTVM, because I don't know what RF will do to a
digital meter (I haven't tried that experiment yet).

I agree. I learned a lot in college, and a lot more in my 20 years of
experience in the field. But what I see lately is, as you say, a lot
of 'myths' being 'perpetuated'. That's why I wrote the page.

www.cet.com/~sparky/cb15.htm

In case you are wondering, it was written for the average CBer, and copied into this ng without my knowledge. If I had written it for this "audience", it would have been entitled, "Hams: More Ego Than Education".

>And why would you "dumb down" a presentation to "the average CBer"?

Are you another mindreader with a ham license? If "dumbing down" was how you interpreted my words, then they are your words, not mine. From what I have seen, the average CBer doesn't want to mess with heavy theory, integrals, calculus, distributed network analysis, etc. I'm not "dumbing down" anything -- I just trimmed the subject down to it's raw components.

If you have something better, I'd like to see it.

Unbalanced currents in a feedline causes it to radiate. A choke balun made with ferrite material can reduce the imbalance by reducing the currents traveling on the outside of coax braid. It basically inductively loads the outside braid of the coax and chokes off the current there.

SWR on a transmission line does not cause unbalanced currents in the two conductors. The coax will not radiate more RF with a high SWR as he claims. To prove this terminate your 50 ohm coax with a 100 ohm resistor. This causes SWR on the coax. Even though there is a standing wave on the coax the currents in the center conductor and shield are balanced. There is no more radiation that if the coax was terminated with a 50 ohm resistor. You can further verify this by taking field strength measurements in both cases (50 ohm and 100 loads). I used to test coax.

Sure you can do this with a DC voltmeter. Your friend forgot to mention one little detail-- you have to touch the probes to the twinlead for a very short time-- say about 1 nanosecond. Then read off the DC value. Ignore the sign. Do this about 10 times and average the results.

More stupidity from your mouth. Need I prove you wrong like I did with your
"measure SWR with a DC voltmeter" fiasco? Do you really have an engineering
degree? Is "impedance of the standing wave" theory like your "standing wave
on the other side of the transmission line" theory? LOL!

****
" The standing wave is called 'standing' because those points of high
voltage and high current
do not move, and the voltage can actually be measured with a simple DC
voltmeter.

The ratio between forward power and reflected power is called the
standing wave ratio, or SWR. The higher the SWR, the more power that is
reflected back into the transmitter. (More accurately, this is called the
Voltage Standing Wave Ratio, or VSWR, and is the ratio of the maximum
voltage to the minimum voltage along the standing wave.)"
****
*

Can specifically point out where he said SWR is measured with a DC
Voltmeter.
He said you can measure the Voltage with a simple DC meter. He didn't say if
you
needed a rf probe or not. He also didn't say how to do it. You really take
things out of context ...
Is your name twistedhed

"Metal" superiority? Hmmm. So you are saying your measuring SWR with a DC voltmeter was a typing mistake? Yeah right... more backpedaling.

I have already proved you do not understand the implications of standing waves on a transmission line.

> But when faced with a simple little technical
> problem that they can't answer (my favorite example is the 6:1 balun)

The construction of 6:1 baluns (or 6.35:1 or 12:1 or 1.5:1 or 2.942:1 etc...) has been discussed many times on r.r.a.a. All you'd ever want to know about baluns is contained in the book Transmission Line Transformers by Jerry Sevick. Maybe you should purchase a copy if you don't already have it.

===

Is there any other way?

I don't know about that side of the pond, but over here it is not easy to
set up a *legal* broadcast station. Obviously, the transmitter must be
an approved one, and a licence is needed... but it is not within the reach
of individuals or even a small family businesses to set up a legal station.

Plenty set up Pirate stations and make loads of dosh with advertising or
by taking payments to give certain records "airtime" and so promote them.

Over here, you could set up with a pirate VHF FM transmitter and
antenna for a few quid (less than £20). Not a very good one, but it is
often done.

Brainbuster.

===

That does not make it appropriate for a CB newsgroup.

So, you seem to know more about Birmingham than I do... what
does that tell you?
Do the words "wrong" or "troll posts" come to mind?

Maybe your roots are there, unless you stop up all night trying to
find information about the place... that's a serious obsession.

===
> >You and your "buddies" have made a mess of rec.radio.cb
> >and now want to start on this group?
>
> Come now old bean, look at the facts. You are a CB'er from the UK that
> has been posting on a largely American newsgroup for months.
===

Excuse me, Aaron... but where is the "America" in "rec.radio.cb"?
Exactly... nowhere. Just because some of you sit there posting
all day, does not make it your's.
It is for CB anywhere, most of the users accept that fact... why
can't you?

===
> You've had a heavy hand in whatever "mess" now exists on rec.radio.cb.
===

I see, I have been on the Internet for a year, and you want to
blame me for what was there before I came along?

Am I to blame for the fact that you have to keep launching
attacks on people who are not bothering you?
How about the language used by your mob, am I to blame for that?
And the sexual innuendo used by Georgina?

Don't be so stupid, take responsibility for your own actions.

I am willing to put you back where you belong... the killfile, but
are you willing to stop the unfounded acusations and lies that
you put on the newsgroup?
Don't you think your game has gone on long enough?
Is it not time to remove the mask, and reveal who you really
are... or has it gone that far that you fear the backlash?

Brainbuster.

Well, if you have a problem with me being friendly with the other
group users, and giving advice rather than abuse, you can block
my messages.

===
> Every chance he gets, he denies being a "brummie".
> God knows what set him off,
===

Have you considered it may be your constant whining, calling
me a "Brummie" every chance you get.
That, coupled with the fact that I do know where I live, should
have given you a clue... it's not that hard to understand, is it.

===
> So do us a favor and keep him here for a bit until his
> knickers get un-knotted.
===

Sorry, but it is my decision where I go. You may not be used
to this, but the UK group show a bit of respect for each other.
Or is this like a threat... I leave "your" group, or you spread
the rubbish to the UK group?

I realise this is a new concept for you, but you could
learn respect if you tried. Ask one or two of the regulars on
"rec.radio.cb", they will be able to help you.
Even the *real* pro-legal people show repect for others.

Regards,

Brainbuster.

Actually, no you don't. SWR is the ratio of Vmax to Vmin on the
standing wave. The wave doesn't move (standing?) and can be measured
as a DC potential. It's easier to measure on twin-lead since you don't
have to poke through the shield, but you can indeed measure SWR with a
DC voltmeter.

Could I make it any clearer for you George?

BTW, Bert, the reason why part of the Carolina Windom's feedline radiates is because the Windom is itself unbalanced due to the off-center feed point of the antenna.

568. Will "Jicon" Break The Record For Troll Posts in rrcb?

Hi Bill,

Of course I used to pull them free out of the back of old tv sets.

One can easily deal with some of the sweep tube non linearity by placing
10 ohm MF resistors in each tubes cathode lead. The degeneration will make
the circuit mo'betta'.

Todays dollars vs mid 70's dollars... the tubes are a similar good value.

cheers

Depending on the duty cycle and your power transformer size and secondary values, even a tripler might play with ceramic tubes. As I mentioned, I've got some pictures of a sweep tube amp converted to a pair of 4cx250's by an Italian Amateur).

Wanna have a look...?

The only thing amusing is your backpedaling, Frank Aaron. <<

>I don't call it "backpedaling". I call it a torch that I can hold high for everyone to see how people like you and those idiots in rraa will take a simple typing mistake and turn it into prima facie of their metal superiority.<<

LOL! Idiots in rraa, idiots in rec.radio.cb....Franky, you sound a bit paranoid, OM.

> But when faced with a simple little technical problem that they can't answer (my favorite example is the 6:1 balun) they squirm and twist all over the place. <<

Balun? Now THAT'S a squirm. No one mentioned a balun.

>Do you really think I care what you or any of those super-ego hams think?<<

Oh, but of course....one hundred percent! As a matter of history, your posts show exactly that. You are self-conscious and self-absorbed, all too consumed with what all us strangers and cb idiots think of you. This was verified long ago by your humorous attempts at putting forth your tech schooling and repeated pompous self-elevations comparing it to a real degree offered by universities..not that it matters to most of us, but you apparently think even less of yourself than we do, based on your constant struggles to paint yourself as someone above the rest of your peers. The clincher is taking the wind out of your sails with nary a word nor insult but merely the truth. Attributing Gepetto-like status to me is wrong. Someone else is making you react.

>Of course not! But I can sure play their own game right back in their face!<<

But you suck at it. You are how old and still not able to communicate in an adult-like fashion.

>Like I said before, if you want to see something funny, post this simple question to all those newsgroups you spammed in your quest for intellectual satisfaction: "How do you wind a 6:1 balun"? <<

Nah...you post it,,,no one else cares about baluns..they're mostly interested in watching you drown in your other comments..

>In fact, since you think you are so technically superior, answer it yourself!<<

Ahh, yes, that is effective....
Always attacking the ones who prove you wrong. He has nothing to prove. It is readily apparent to all those who are technically adept, and even those who are not, that he has apparently proved you made an incorrect statement. One doesn't even need understand the problem, merely reading your new excuses that you were "jerking a chain" tells more than you wanted it to. Woof-woof!
Instead of owning up to it, you do this song and dance (Gepetto induced, no doubt) .

> Yeah, answering that EASY question might just be a good idea, because your constant begging is getting really boring.<<

It's not begging, Franky, it's "pegging"...as in "pegging you for what you are.".

583. power cords

Newsgroup: rec.radio.cb

: Richard McCollum <rmccollOMA@worldnet.att.net> wrote:
: Finally found out what a Phantom was. Believe it or not it was type
: accepted for 27 for the cabs which presumably means it was Class C FM but
: maybe not, there were a number using Ancient Mary. Thanks to the back
: channel.

Let me tell you what the Phantom Amplifiers are... Made by D&A Mfg in the midwest... a few different models were built. These are the famous Phantom 500, the Phantom Plain and the Phantom 700/750. There might have been a few other versions of the Phantom. It's hard to keep all the trivia straight...

The original life of a Phantom was a grey cased sweep tube amplifier. Some models with the shear number of 6LQ6 type sweep tubes were a marvel in design. Very well built for what they were... all steel chassis and solid construction. Most were two stage amplifier circuits...

D&A also made the famous Hawk, Scorpion, Hornet and a batch of other models. Each model was a specific power range, circuit or application. They were made for AM low drive operation... ie back when CB amps were legal to build.

You can see the PDX Tan color built amps on Ebay, which are the post generation Phantom amps... most are tamed down from the 12/10 tube phantoms... a PDX 400 comes to mind. Most of the pdx amps are pretty dirty (the ones I've seen up close). The Phantoms were of an earlier age and didn't operate to bad. They should not be grouped under the same description...

: Apparently it came in two versions WRT the power supply, one with three
: xfmrs, one with two and separate filament etc supply. In either case you
: are in business. My guess is that they paralleled two or three xfmrs at
: about 700 which means you can series the secondaries to get to 1400 or so.

More than the two versions were made, but the real history is hard to know this late in the game... I still have one in the garage somewhere... think it's a 500. One of those transformers was for the heater voltage.. you gotta know those 6LQ6 tubes draw all kinds of heater current... amps and amps of it.

: If you have the 3 version I would pull another stunt. Use two in series
: and the third in a standard full-wave (if CT is available) to get 350 or
: so for the screens and pump this into the CT of the two in series to get
: up to 1750 or so for the plates. GE used this caper in their base FMs to
: prevent screen voltage without plate voltage and reduce the plate in the
: absence of screen voltage.

Ahhh... the famous GE EP-38 power supply... been working on a master pro have you..?
I think that www.cbtricks.com might have the phantom circuit diagrams available.

: If the xfmrs had 5volt and 6.3 filaments some
: unused windings will get you enough that with a voltage doubler you can
: get the -45 or so of bias needed for AB1 which does not draw grid current

I'm pretty sure the amplifier was AB2, at least in the final section. Lets hope it was..

: so bleeder current is about all there is. Or if you watch polarities very
: carefully or use an isolation xfmr get the bias off the line. You also
: will need some keying voltage as well.

There were windings for relay and bias on some...

: The Phantom probably drew something in excess of an amp at 700 volts which
: means the tank is designed for about 400 ohms and 1750 at 400 ma will give
: you an input impedence ((V/I) * 0.6) about 2500 in AB1 so you need to dig
: out the formulas for the output pi and I do suggest 1/8 tubing at minimum
: and more likely 3/16.

I figured the tank near 500 ohms... once in a past life. One might notice the physical size of the tank coils... thick as a brick, which it should be. No AB1 in this or similar amplifiers... AB2 is the rule of the day.

: Check the Eimac site for cooling requirements. For Antique Modulation or
: digital stuff you are right at the bloody edge so follow their
: requirements. Much like the major function of a thermostat in a car is to
: keep the coolant around long enough to pick up some heat rather than blast
: thru the engine, these tubes do have some fairly stringent requirements
: for flow and back pressure. Sideband is not quite so pissy but do it for
: the drill anyway. Eimac sockets and chimneys are not all that cheap.

I'm not sure if Phantoms had fans on them, but most people put boxers on them to keep the tubes cool. A pressurized chassis underneath and some well drilled holes around the tube sockets to allow airflow past up and around the base pins while in route "up and out" is one of the best things going.

: The grid input I will leave to you because I have no idea what you are
: driving it with but be forewarned that the 4CX series are pretty much
: 'blow on the grid' in AB1 and real easy to over-drive. They are also very
: particular WRT filament voltage as directly heated cathodes tend to be.

4CX250's can be run AB1 or AB2, depends on your available drive which you should use. Four watts into a proper AB1 will drive a single tube to over 300 watts output.

: You should shunt feed the system which means several things. First off
: the inevitable protection against a shorted coupling cap to keep 1750
: volts off your antenna and a check with a GDO to be sure the RFC is not
: self-resonant in an amateur band in case you decide to add some coil stock

: and a bandswitch and use it on 20 etc. This is primarily why I suggest
: great shitpots of research before you cut metal: there are a lot of goofy
: things that can bite you in the butt. If you understand why some
: designers did the things they did you will experience any number of whacks
: on the side of the head and think 'Thanks I needed that'.

I'd follow a well known and proven circuit...

: Good Luck
: Dick, present at the birth of Rock 'n Roll

cheers
skipp

Yea, we do, but which one of us does he consider his puppetmaster Gepetto? He has accused 4 of us in the past week and a half of being obsessed with him and really believes we are in control and he has no chice in the matter. Calls it a natural reaction.

586. Sweep tubes to ceramic

Newsgroup: rec.radio.cb
Date: 2002-06-05 22:53:10 UTC
From: Skipp <skipp@pilotNOSPAMPLEASE.ucdavis.edu>
Message-ID: <adm4omoip9@woodrow.ucdavis.edu>
Source record: 126434
Cross-posted to: rec.radio.cb,rec.radio.amateur.homebrew,rec.radio.swap

In reference to another thread where someone asked questions about converting an amplifier from 6LQ6 "sweep tubes" over to 4CX250B "ceramic" tubes...

Here's a web link to a few photos of a Dentron GLA-1000B which was converted over to a pair of 4CX250's by an Italian Amateur Radio Operator. I also have pictures of the same amplifier with some of the newer Russian GU7 series tubes on board, but that's off topic. Anyway have a look if your interested.

Oddly enough, Aaron was right -- we have had some pretty good gusts
today. But no, Randy, it's not usually damp here. Spokane is in a
semi-arid region. You probably thought of Seattle and then ignorantly
jumped to conclusions about the rest of the state. I would expect
nothing less.

So Randy, how does one-way skip affect band noise differently than
two-way skip?

Yep. It struck my funny-bone.

I think the noise you are hearing is your ass when you try to pry
yourself out of the chair in front of your computer. Of course the
same thing could be said about Timmy's ass -- talk about someone in
need of Jenny Craig!

I doubt it. You haven't quoted one line from the book. I don't even
think you have the book, you just found the title on a web search.

> Since you are too
>lazy to check it out why don't you tell me how you think a 6:1 should be

Sparky, admit it man. You've been spanked.

BTW, there is a version of your "strange coil" that is widely used in the electric power transmission industry. Next time you drive by an electric power substation, look closely at the transmission lines that go in and out. Not the distribution, but transmission. Normally, it's only on one of the phases, one on the incoming side, and one on the outgoing side(most transmission systems are loop fed). It will have a coaxial wire that goes from it to a terminal box where is it coupled to a data transmission system. They are commonly called wave traps. They allow data to be sent over the high voltage(138KV+) transmission lines to another substation safely. It's also rather old technology and is being phased out in favor of SCADA microwave systems. Not really so strange after all.

I can't say I have ever seen anything like it even at WWP (now called
Avista) when I worked there. But I suppose I can drive over there
tomorrow and take a look around.

Hardly. I got chased by a baby moose into some poison oak while
camping last weekend (which is why I had to cut the trip short, or
else I'd still be out there), so I'm kind of limited in my activities
for a few days. How about you?

602. Wilson Lil' Wil

Okay, I know there is a simple answer to this, but. I just bought a Lil' Wil antenna for my 2002 Suburban. (it's really the wife's Suburban) I have 102" whip on my F150 mounted to the body of the truck. Anyway, I noticed that when someone was directly behind me I couldn't hear them on the CB, but I was getting about 7 miles of conversation otherwise. I don't have this problem with my whip. I had the Wilson toward the front, roof of the Suburban. Is this the issue? I could not transmit or receive at close range. No, I haven't had it tuned yet, could that be the issue? Any help would be appreciated.

You are still confused. I asked -you- how to wind a 6:1 balun, yet you
seem to think that -you- asked -me- the same question. Has your
obsession progressed to the point that you are having delusions of
being me? That's SICK!!!

Ouch that hit a nerve didn't it, Frank Aaron? Your need to respond shows
that it did. I knew I'd get a reaction from you on that comment. Dance
clown, dance. LOL!

When comments are made about the fake pictures of your *other* identity you
don't flinch - it isn't reality. But when someone mentions your real
picture you squeal like a stuck hog.

The physical construction of a 6:1 balun is described in the book I
referenced so obviously I do know how to construct one. Since you are too
lazy to check it out why don't you tell me how you think a 6:1 should be
wound and I will tell you if you are wrong. Or are you afraid your
technical ignorance will be evident again? I'll bet *you* will squirm away
from this one.

Rec.radio.cb is your home (and a fitting one for you), I am just visiting long enough to make you sing and dance like a clown. This is exactly what you are doing; you haven't posted this many responses in such a short period of time for quite a while. Dance clown, dance!

Just wrap up the ankle. What's the problem? I've done it lots of times. And don't forget that I have a lot more weight on my ankle. I even went waterskiing with a cast once. If I can do it and you can't then you must be a wimp.

Frank Aaron, obsession isn't something you should be anyone else of -
POT-KETTLE-BLACK.

Obviously you feel that your arguments are so weak you have to clone
yourself to make it appear that someone else agrees with your nutty ideas.

My, my, my. All this 'sturm und drang' over being embarrassed that you
could not address a simple question you kept avoiding: How does
one-way skip affect band noise differently than two-way skip?

You know, that might explain Randy's drunken tirades the past few
days. Maybe he was at the breaking point, then went MPD! I wonder how
many personalities he has now -- enough to fill up a box of Chicken
McNuggets? Or maybe just enough for a double cheeseburger? Maybe he
-really- went bonkers and split into a small order of fries?

HAHAHAHAHAHA!!!!!!

>are wrong everyone will get a good laugh like they did over in r.r.a.a.

Why? I'm still waiting for your alternate personality/butt buddy to
come up with his explanation why one-way skip makes a difference on
band noise than two-way skip. Get him to explain that and maybe we can
talk about baluns. But of course that won't happen either...

Nice try Frank "Sparky"Aaron. Next you'll say that you thought Sparky asked me the one-way two-way skip question and not Randy.

Of course it could have been an honest mistake (wink wink). I realize that you have a double load in trying to respond to all the threads on rec.radio.cb.

Again, nice try Frank Aaron. You know very well that you have hounded Randy
with that question and not me. Next you'll say that you misunderstood and
it was an honest mistake. LOL!

Shouldn't you be asking Randy?

My answer to the question:
One-way skip is more aannoying then Aaron because the goof in
Oklahoma is calling & calling & calling & calling & calling
for DX. Everybody over here gives him a try. He's so loud we
can't talk. He can't hear us. Hit the switch and try again.
Go on top of big hill and point front of car in the direction
of Oklahoma. Energize 4 pill. Bastard's got three lights lit
on my PC122. Still can't hear me. With two-way skip, the
band is more together. Most folks will wait for a turn.

Source record: 126513

Personally, I think the "lil wil" is not long enough to be of much use. Any antenna that short takes a severe performance "hit" on the CB band since it's only a fraction of 1/4 wavelength. Even when a lil wil is tuned up "p" perfect, it's gain is only perhaps -6dB below a 1/4 wave whip. The trade-off is always one of performance vs. length(convenience). My opinion is that any antenna with a radiator less than 4' is a very poor performer...

Just a guess on the less than 50 ohms. You may have misinterpreted other posts. A quarter wave vertical over perfect ground (a huge conductive plate many wavelengths in radius) will have an impedance not a whole lot over 30 ohms. The typical groundplane has perhaps 4 rods serving as a ground. This will raise the impedance of the antenna. Whatever the resistive component, going up in frequency will result in an additional inductive reactance in the system (raising the impedance above 50 ohms) and going down from resonance will result in an additional capacitive reactance to the system (again, raising the total impedance). At resonance, you won't have any reactance, what is left is pure radiative resistance. A short antenna has considerable capacitive reactance. This is corrected by adding a coil which adds enough inductive reactance to cancel out the capacitive reactance. Voilla! You are left with a resonant antenna; albeit with slightly less radiative resistance. With extremely short antennas (such as an amateur running mobile on 75 meters), this can get to be a real knotty problem as radiation resistance may be on the order of 1 ohm.

BTW you are 100% correct - a coax section can, indeed, be used to change (or match, if you prefer) impedances. The high swr will still exist in that matching section. Your radio, however, will only see the impedance that it wants to and everyone is happy.

High SWR won't cause coax to radiate. A problem occurs when you feed a balanced load (such as a dipole) directly with coax without using a balun. THEN you get radiation from the coax. Besides, you CAN use a coax matching section to convert from one impedance to another. There will exist some (possibly high) SWR within that matching section, but everything else (including obtaining the desired output impedance) will work just fine.

Dickless? Ha! From the looks of your ISP AD you are dickless! Or are you a drag queen!!!!!!!!!! HAAAAAAAAAA!
Rescue? I dont think so, Bitch! As a MAN i need no rescue nor feel the need to rescue anyone.
CB hater??? What planet are you on???
You seem to be the one with an attitude toward operators of the CB or 11 meter band. As a previous card carrying amatuer,
i find no use for Ham radio. I have much more important things to do. How about you? Time to get off to High School class?? I've seen your poor typing skills.
You brought on the insults, i simply am a result of your lack of respect for others.
I express my opinion, speaking of which.....Now, once again, to make sure you understood, drag your stupid ass back into that hole you crawled out of, ASSWIPE!

"If it aint broke, don't fix it"

Frank Aaron, if it makes you happy to think that I am Randy then knock
yourself out.

Seriously though Frank, it must be exhausting for you to maintain two
identities - one of them being fictional. I know that it probably makes you
feel a little better about yourself that you have created a fictional wife
and kids - something you lack in real life. You posted over in alt.love for
a while but judging from the real picture on your web site it is obvious
that you will die a lonely man. You were rejected. Is that why you are so
filled with hate?

Well when you are addressing someone by a name, one must wonder where you arrived at calling me George, I didn't introduce myself to you as george. You are new here right? Asking you to prove something else is a stretch, since you are intent on "Proving " Sparky wrong.

Pick up a copy of Electromagnetic Waveguides and Transmission Lines by Frank
Olyslager. This will do a better job of proving you wrong that I ever could
(being a dumb cber). Of course I doubt you will make any attempt at
educating yourself preferring to wallow in ignorance instead.

Well I remember Randy said he was gonna try to get into my computer or see
If I had some ports open so you never know what he is capable of hacking
into.
Sounds like he is using some type of remote administration program

Wow Jicon, of all of Sparky's posts to choose from, you pick the
one-way skip debate with Randy. LOL

I gotta go read that thread again and get some tips on what got you so
riled up.

Sorry to hear that.

>How about you?

I screwed up my ankle water skiing so I have some free time on my hands
until the ankle heals up. I just took delivery of a 2002 Yamaha LX2000 jet
boat and I am kind of bummed that I am not out in it right now. Otherwise
I'd be out on the lake.

If you want to know how to wind a 6:1 balun get the book. It will explain
it better that I ever could without pictures.

Tell everyone here how you think a 6:1 balun should be constructed. If you
are wrong everyone will get a good laugh like they did over in r.r.a.a.

Why don't you put on a little calamine lotion on your poison oak and go back out in the woods? I have done that many times. I even went camping with calamine lotion on once. If I can do it and you can't you must be a super wimp.

To be honest Frank was skeptical at first, and there was a bit of intramural debate regarding who you were, but since I keep running profiles on all major keyclowns I was able to build a case and then present my findings to the others.

So Randy, why THE HELL did you have to hide behind the "jicon" thing to discuss SWR with Sparky? Does he intimidate you that much?

So that is how you actually got your poison oak. You were out in the woods
with your channel 19 trucker boyfriend. While he had you bent over you lost
your balance and landed in the poison oak. What made you loose your
balance? You got carried away fantasizing about Tim's ass?

Jicon, Sparky has a LOT more real estate to cover with calamine than most of those that inhabit the planet.

Randy

Yes it was fun seeing you spanked first in r.r.a.a and now here over your "measure SWR with a DC voltmeter" debacle. Next time be careful about the accuracy of what you put on your web page especially since you try to come off as an expert on everything technical as well as try to harass people on this newsgroup.

Come on George, don't be so lazy. With a little detective work you will
discover that I have been posting to r.r.a.a. for years.

683. Frank "Sparky" Aaron disappears

Newsgroup: rec.radio.cb
Date: 2002-06-06 05:02:24 UTC
From: jicon_101 <jicon_101@yahoo.com>
Message-ID: <A1CL8.16489$zh2.7592004@twister.neo.rr.com>
Source record: 126583

Notice how both of Frank "Sparky" Aaron's identities disappeared at the same time for the night. Frank Aaron's mommy made him turn off his computer.

684. Randy GO TO SLEEP already

Newsgroup: rec.radio.cb
Date: 2002-06-06 05:14:35 UTC
From: aaron_h_voobner@yahoo.com
Message-ID: <d014ebfd.0206052114.15a26b7c@posting.google.com>
Source record: 126584

Randy panted:
>Notice how both of Frank "Sparky" Aaron's identities
>disappeared at the same time for the night. Frank Aaron's
>mommy made him turn off his computer.

Randy. Now you're acting like a "Dumb CB'er". If you're still upset,
do what Twisty does. Go kick the dog.

This is a quote from the eBay auction:

It has been Turbo Tuned by Express Electronics and they wired the new D-104 for the radio. That's it. No "golden screwdrivers" have been in this radio, not a screw turned.

This makes no sense what so ever! EES's "turbo tune" has been shown by many to be THE WORST hachet job done to radios since Christ was a cadet. This mod setup had killed more radios and caused more radios to fail then anything I have seen yet!

You are as bad as Frank Aaron searching Ebay for illegal equipment to
report. Since you obviously have no intention of bidding on the item why
the hell do you care? You must think you are an Ebay cop like Frank Aaron.
Or are you just upset that someone might buy this radio instead of some of
the illegal junk you sell?

Even if that DX 2517 wasn't turbo tuned it still would be a piece of junk.

I've seen that. Yes, Aaron seems to be just as upset as Frank. I wonder
why? LOL Frank "Sparky" Aaron is upset that I've identified the man
(child?) behind the curtain. He thinks that his backpedaling has vindicated
him on his standing wave theory.

Hello TSH:

The Lil Wil Antenna is low performance antenna, but should still work reasonable for you. I have one on a old car I drive out in the Desert, and it works fine.

It is a possibility that it is directional causing a blind spot in the back direction.

Suggest you have a base station give you a count while you drive the Suburban in a circle in a open area, while watching the S-Meter, to see if it really does have a null or blind spot in the back direction of the Suburban.

Even with the antenna mounted foreward or backward, I don't think you should see a radical null in any direction.

Jay in the Mojave

We were talking about rec radio.cb for starters and you reading all the
threads, but I see you missed that point,
and you probably have posted in rraa just under a different name as well
as sci.electronics.design, so what name have you used there?
Or is it a secret...

>My answer to the question:
One-way skip is more aannoying then Aaron because the goof in Oklahoma is calling & calling & calling & calling & calling for DX. Everybody over here gives him a try. He's so loud we can't talk. He can't hear us. Hit the switch and try again. Go on top of big hill and point front of car in the direction of Oklahoma. Energize 4 pill. Bastard's got three lights lit on my PC122. Still can't hear me. With two-way skip, the band is more together. Most folks will wait for a turn.<<

Hahaha! I chuckled out loud reading this....I can sympathize...we had one of these guys just a little way northwest of me for over a year. 3 element on the flat side riding 38 low and always running 500 watts. Not a bad guy, just dense as hell. No matter where the next DX call came from, this kid HAD to be the first to talk. Total monopoly of the freq. Got to the point that if we heard him, we just changed the channel and went somewhere else. He finally ended up moving, thank God.

WAZGV, KA6SCO, etc etc etc.

Landshark

If you are implying that people, who hold ham licenses, should be somehow held to a higher moral standard than the "common man", then that would be faulty logic. A ham license is only a "permit" to use radio, it is not a "badge of morality".

Message-ID: <tyKL8.21857$Gw5.726107452@newssvr21.news.prodigy.com>
Source record: 126625

Good God George/XXXXX funny how
when you go to dejanews, his post aren't there, so it
must be X-No archives. If you have Mopar's posts,
then you are saving them, which means you are
obsessed with this newsgroup and the people
that post on it, that is most evident by your 297
plus post's in just this group.

Your search - author:Moparholic - did not match any messages posted between
1 May 2002 and 31 May 2002.

Suggestions:
a.. Make sure all words are spelled correctly.
b.. Try different keywords.
c.. Try more general keywords.
d.. Try searching over a larger date range.

Your search - author:Moparholic@hotmailnospam.com - did not match any
messages posted between 1 May 2002 and 31 May 2002.

Suggestions:
a.. Make sure all words are spelled correctly.
b.. Try different keywords.
c.. Try more general keywords.
d.. Try searching over a larger date range.

Also again your distorted view forgot all of your posts
under the assumed nics:

20 George, 40 voobusch, 13 blunt man, 19 geoaaron, 15
privateeyes@whocares.com 7 mash707@klinger.com, 14 zoltar, 50 candycane, 65
landsharksuxs. 12 rubbernecker
29 janedoe994@msn.comm, 13 mrbusch707@gator.com

Grand finale 297, which makes you the top poster again,
you get the cuppie doll! You have to go to Mopar's to get
it though <G>

Lets see you call Frank Aaron? you call Aaron Frank and you call me George.
LOL I see it is word association game.. Funny thing is you seem to think you
know everyones name and no one knows yours? Why is that. Oh btw, which name
do you post under in r.r.a.a.?

Ok tim, but this never stopped anyone from telling Aaron over and over
agin.. I just wanted to see if you guys really don't like the spam or the
delivere of the message... I am starting to see you guys don't really care
about the spam just the person who is the deliverer.

If you are not George why do you care whether people call you George? So
far I have been called a few names and it doesn't bother me. I figure
whatever floats their boat... OK, George?

The answer is waiting in r.r.a.a for the non-lazy. Let's see if you can win
the prize.

The way that you react to being called George is inconsistent with your
claim that you are not George. If you were not George then you wouldn't
care.

Later George...

Not Lazy at all I lookd up and down the roster of posters there and see no
one who calls himself James? I see no one there who posts as much as you,
give me a hint what do i look for? hey maybe your James Hambrecht, Maybe
your Cecil, he is a cber too ya know ... .

BTW, I said you can call me James. I didn't say that James was my real
name.

Good God Landshark, I don't save Mopeds post, LOL like you do of me
"""Means your obsessed with me "" the statistical info is readly available
to anyone who knows where to find it of course he uses X-no archive you
knew that, So does that mean you just don't include him in your skewed
results.
How did you arrive at 297 posts for me.

So now I am George? Is that what you are saying Phil, Please clarify! You have just accused Dwight of being Aaron without proof of course. I just want to be sure I understand what you are saying. This seems to be a habit of yours.

You should take a trip up the great Pacific NW sometime, twist. Even a
small moose can weigh several hundred pounds. Not only that, but they
will charge a person for no reason at all. But they won't head-butt a
brick wall, so I guess that sets them one step above you on the
evolutionary scale.

You do it and it's retro, I do it and I am an old fart.

Score one for you on the GE. We got one from the sheriff in Quincy IL and put it on the air in STL. I still hate germanium transistors :-)

The circuit is not the real problem here and you can get all you want from various old Handbooks among a lot of other places. The planning is more fun than the execution to me but the troubleshooting is far more educational than either.

Big Kahuna

>Dick N&#65533;BK

Dick, the question was about the modification of a high-power RF amp. Maybe the psuedo-ham facade fooled you but it didn't fool me. Not only is the amp illegal for use on the CB (regardless of it's intended and poorly disguised purpose), but the content of the post involved technical issues that are not even close to CB radio, such as the conversion from sweep-tubes to ceramics.

Converting an illegal amp to legal by shifting it a couple megahertz is really no big effort. And converting glass to ceramic can be a monumental project (and sometimes not worth the effort). In either case, the "gold" would more than likely be found in a forum where such practice is much more common, and the information gained from similar experiences are expected to be more accurate and reliable than the few grains of guesswork from the voodoo-CB-tech community.

So Dick, if you are not even interested in CB radio, why are you here? To help out the illegal operators that might otherwise be chased out of the ham groups with their technical questions? That's the way it's starting to look.

He isn't the one running from baby animals.

>>You should take a trip up the great Pacific NW sometime, twist. <<

Klamath Falls, Eugene, mucho backwoods camping in the Cascades..Crater Lake (mosquito hole)..the clothing-optional hot springs in Umpqua a ways east of (Roseburg???)....Further north up in Washington the weather is too damn damp and wet for me, at least the coast is.

>>Even a small moose can weigh several hundred pounds. Not only that, but they will charge a person for no reason at all.<

One should never run from wild animals..it triggers their predatory instinct to give chase, especially carnivores. 3 words.....climb a tree.

> But they won't head-butt a brick wall, so I guess that sets them one step above you on the evolutionary scale.<<

Animals never bothered me, even the wild razorback hogs we hunt. Once again, it's all about communication skills, whether it's with people or animals. It's nice to know your traits are not limited to humans and extend to the creature kingdom.

Hi,

I was thinking about getting a Wilson 1000 Magnetic Antenna. I don't want to drill any holes in the truck, because it's my work truck, and I don't own it. On my personal truck I have a 4' fiberglass whip, and want something equivalent to it. Is this a good antenna, or does anyone else recommend a different antenna?

I guess the concept of Legal Cbers is far fetched huih Tnom, with all the talk about amps and mods, and keydowns you would think it to be legal if you were a newcomer to the hobby wouldn't you.

Sparks, it is/was an 11 meter amp. The use is 10 meters. Seems perfectly reasonable to do ones digging where gold is likely to be found. This is not some idea, the beast exists.

Granted we are in an area where the legalities are known but the ethics are a bit fuzzy: Z-Duck knows them as well and did not propose anything illegal. So within my experience I gave him an answer; Skipp likes to go a bit more balls to the wall than I do but WTH. Things like that make horse races and cause dragstrips to be built.

Aaronia has her usual bleat about my answers as if my not answering would somehow cause them to go away. I long since quit making that sort of judgment for functioning adults but decided that if I had any contribution to make it was to make them cleaner, safer, and somewhat less of a fire hazard. Actually, my real hope is just to save the sheep some money by pointing out how they are being fleeced which gets me pissed on about equally by both sides but I knew that going in.

One nite on NPR I think a doc from San Francisco was on who did things like show friends how to revive a heroin OD and in general keep the poor bastards alive. He, of course, had the legal/moral freaks on his case. His observation was that there are 'judgers' and 'helpers' and he was a helper. To which I would add that a real solution will and must have elements of both to work: the helpers will roar off into a flurry of activity that never gets to the problem while the judgers sit smug and happy in their purity while people die.

Now this is not anything nearly so serious and I make no claim to be Mother Teresa or Desmond Tutu or anything resembling it. Defining the

problem or sermonizing on it is no trick, the fun begins when one actually tries to do something about it.

Besides, it's fun and my hair shirt is at the cleaners.

But what does that have to do with CB radio? Why even bother calling
it rec.radio.cb? If there isn't enough talk about CB radio to keep
everyone busy, does that mean it should be the primary newsgroup for
amps and freeloaders?

>And while that is certainly the most likely situation it is far from the

>Dick, the Velvet Codpiece. Tell no little lies.

I'm not talking about Gog and Magog, I'm talking about a fundamental
principle of this group being totally ignored. Granted I have spoken
my peace more than once on amps, but usually in contempt of the

splatterboxes that haunt the band. If you want to 'rec', great. But if you insist on playing horseshoes just outside the first base line, don't start calling foul balls -- it ain't your game.

Selective illiteracy again. I shall repeat what you have conveniently
snipped: "I said it was not appropriate for a CB newsgroup and more
appropriate for a ham newsgroup."

>Simple. Isn't it?

Yes it is. It is just as simple to find a more appropriate forum for
the discussion. And that would have prevented the entire discussion.
Come to think of it, that would be even simpler, wouldn't it?

Oh brother. Putting yourself in the same league with that doctor is
the height of arrogance.

He is helping to keep people ALIVE after they OD. That is called FIRST
AID, or EMERGENCY MEDICINE.

What you are doing is the equivalent of giving instructions to junkies
on how to cook up "a higher grade of heroin with more purity".

>He, of course, had the legal/moral freaks on his case.
>His observation was that there are 'judgers' and 'helpers' and he was
a

Dick if you want to show keyclowns how to revive each other after
lethal contact with a power supply, be my guest. At least that would
be a hell of a lot more honorable.

4CX250 tubes aren't the best for IMD performance -- but, they are cheap
and available.

>So now you're at THE self appointed newsgroup cencor/moderator?

I'm real curious now: Just how do you keep reading things in my posts
that I don't write? Is the obsession in your mind so powerful that it
is making you see some words in my posts that aren't there, and
ignoring some words that -are- there? Or have you become so
discouraged with the practice of rational thought that you now rebuke
it with contempt?

>If you want to moderate then get your own newsgroup. I'm sure you'll
>have a great following.

If you want to talk about topics other than CB radio then get your own
newsgroup. I'm sure you'll have a great following.

The king of guesswork from the voodoo-CB-tech community.

Now then, explain how you use a DC voltmeter to measure SWR on twinlead.

I don't know for sure just what his intentions were, and neither do you. If as you say and I suspected (gullible maybe but I didn't just fall off the turnip truck) that we are looking for a cheap and dirty way to turn a sow's ear into a silk purse I fail to see how pointing out to him that the tank circuits would need an overhaul, the power supply a rebuilding, and the 4CX tubes need forced air cooling within fairly stringent standards contributes in any way, shape, or form to actually getting it done. The end result was that he found he could salvage some parts and little else. BFD

And while that is certainly the most likely situation it is far from the only possible one up to and including that he was telling pretty much the truth. And, in fact, virtually anything on the subject is available from any of the last 30 or so editions of the Handbook for Radio Amateurs at least one of which is likely sitting in his public library. Or Bill Orr's books, etc. etc. etc.

So he got an honest appraisal within my capabilities. Lots of people here have gotten an honest appraisal within my capabilities and a lot of them did not like the result one bit. Not my problem.

Why am I here? Damfino but not being one who needs to reason from first principles when it says 'rec' I 'rec'. When it ceases to be fun, I will quit. When the Forces of Good meet the Forces of Evil in a cosmic battle, whether Persian Mithraism or Christian Dualism, my inclination is to go to lunch. The gung-ho shall inherit the Earth and God knows they deserve it.

Dick, the Velvet Codpiece. Tell no little lies.

I think Frank Aaron (Sparkenvoob) is losing it. I didn't think that
exposing your technical incompetence would push you off the deep end. I
guess it did... too bad...

Dick,

Frank Gilliland (Sparkenvoob) is jealous of your technical competence. He would rather you shut up. It pains him that he is not capable of answering technical questions without being ridiculed.

So, Con (may I call you "Con"?), let's say, theoretically, you had an
ungrounded base antenna. Would putting your hand on the base change
the SWR?

So, Sparkenvoob (may I call you "Sparkenvoob"?), let's say, theoretically,
you had an ungrounded base antenna. Would putting a DC voltmeter across its
feedline allow you to measure the SWR?

OK, show me a radio type certified for the cb band that will run
more than the limit for the cb service. If it isn't type certified
for the cb service, then it is illegal to use it in the cb
service.

Source record: 126653

Hi all

I am attempting to compile a list of all public access two way radio services world wide. I am looking for help from anyone who can send any information about hobby radio in you country. Public access radio means any radio frequency that anyone can use without need for technical knowledge or passing an exam.

So could you tell me-
What CB channels your country uses on 27mhz, modes, power output, special channels, license fee etc?
Do you have PMR446? Low power on 49mhz?
Do you have any kind of VHF or UHF CB or hobby radio? Is it hand held only or mobile?

Any info would be appreciated, and in return I will send you my list so far (maybe 60 different services listed) and keep your address to send it to you when its complete.

Thanks
Jack
axlejack@bigpond.com
PS, no need to send Australia, UK or USA. I've got those wrapped up :o)

>let's say, theoretically, you had an ungrounded base antenna.
>Would putting a DC voltmeter across its feedline allow you to
>measure the SWR?

Of course not. You need a polygraph to measure the stress level of the
sweaty hand holding the aluminum base on the ungrounded antenna.
Divide the reading by 2yx4.082 and you get SWR.

Sure do, also said i was bunch of other names too, why dod you beleive I am george...LOL anyhow that was after PhilC started calling me George, I also called my self Jim, but that was after Landshark started to call me Jim... I am who ever you want me to be ... Thought I was aaron, and If aaron is Sparky ...hmmm

> Did you cancel those posts too?

What are you talking about ? Canceled posts
No there not canceled go look for them, I sure got the one from PhilC calling me george and If you find any that pre date those, you on your way to $5,000
but we know you would rather sit there with that stupid look on your face talking shit and un able to back up what you say. Will yopu accept my Offer or dod you have some doubts now that my name is not George. Which is it your looking more stupid as the days go by.

> Someone is sending out bogus cancel messages,I'd never suspect you.

How are any of my messages canceled, they are there for all to see unlike you who X-Archives his posts. but we keep all yours in a nice file labeled LawnBoy.... what are you looking for that you can't find?..... I know trying to divert attention away from the facts..

> BTW,that's a good way to get into trouble.

What is a good way to get in trouble, please be more specific

> You need to stop harassing CBers!

You need to go cut some more Lawns and worry about yourself, LOL you can't handle any more on your plate, especially what I am dishing out... Now about this bet $5,000 is a drop in the bucket for you right Big shot? How sure are you ? Don't get like Randy and not answer the question....

Glad you asked. Since I'm also posting as Sparky, I merely poll
cet.com for the latest update in rrcb, transpose the header info into
a midstream newsreader such as Kornet Web News, then I copy the packet
info to an anon server in Butte Montana, and finally shift the IP info
with the new X-Trace trail over to Google.

Hell even jicon (who ever he is) will surpass George/XXXXX for top
honors this month. He is
going a little heavy on the responses though.

Landshark

--
If you are implying that people, who
hold ham licenses, should be somehow
held to a higher moral standard than
the "common man", then that would
be faulty logic. A ham license is only
a "permit" to use radio, it is not a
"badge of morality".

This answer is more credible than the one you gave to my question about how the superposition of an incident and reflected sinusoid could result in a DC potential as you claimed. BTW, what does "standing wave on the other side of the transmission line" mean, Frank Aaron? Is that something you picked up on the UFO newsgroup?

in my mind of a certain individual. He's hammering the keyboard in a rather lame attempt to keep up the charade of being more than one individual, all the while sipping copious amounts of coffee, sodas, and the occasional Jenny Craig allowed diet drink. This is occurring in a tiny room on the second story of a working class mother's home with a great view of the side of the neighbor's rental house, six feet and three inches away. He paused for a bit once, when a bird landed on the window sill, but mother's shrill voice quickly scared the bird away. Because of that one experience, he's now resolved himself to never give up the crusade of hammering home the virtues of being a legal CB'er, at the expense of: any sign of a love life, real interaction with a living, breathing person in his presence, having children, pets, friends, hobbies, or a life in general. Really a sad little(or not) man.

His one (hopefully)saving grace? Most pity him, no one really despises him enough to cause him harm.

> > am george...
> >
> Why dod I? Cuz you said it..are you a liar?

Now your asking me if I am a liar? I thougth you guys said I am a liar and
all kinds of other things. I said It awhile after PhilC/Jicon said I was
George,
Remember when he was going to expose Aaron?

> >>LOL anyhow that was after PhilC started calling me George, I
> > also called my self Jim,

> Why? Are you retarded?

Why?, You guys were begging to find out who I am, sd jones had a reward out
for the info and you thought you had me LOL Who has who now?

> >>but that was after Landshark started to call me
> > Jim...

> So..whatever anyone calls you,you'll go by?

Sure why not, I told you I am who you want me to be, remember I am slos
Sparky and Aaron, you guys said it so It must be so.... just because you say
it makes it so, you guys are always right well at least you like to think
you are Haha....

> >
> >>I am who ever you want me to be ...

> I don't want you to be anyone,other than yourself. Can you concieve of
such

> You've lost me..again.

Ok, I am also said to be aaron, ok with me so far, then If aaron is sparky
as you guys say, are you still with me, that would make me aaron, sparky and
george.

> >>you on your
> > way to $5,000
> >

I thought I was Jicon?

824. President P400 extra channel range (with a modification)?

Newsgroup: rec.radio.cb
Date: 2002-06-07 02:25:35 UTC
From: Mayor <nonelwishtodisclose@nospam.none.ok?>
Message-ID: <zQUL8.26295$092.877756@news1.east.cox.net>
Source record: 126673

Has anyone tried to add extra channels to a President P400? I think this is the same radio as the Uniden Washington. In my President P400, I have the "B" Expo kit...26.525 - 27.845Mc. which is good coverage, but I am curious, is there another way to get a different range of frequencies out of this radio?

I have heard that you could use the MB8719 PLL to go from 26.815 - 28.045.....But, on another forum, this guy said that he got a coverage of 26.325 (or maybe 26.175?) - 28.045, or something like that. Is it possible to get that kind of coverage out of this radio with the MB8719 PLL? I've not seen any sites on the 'net that says it can be done, but thought I might just ask someone here. Thanks in advance for the help.

The sounds of coins dropping from
the hopper paying off the player..... LMAO!

Landshark

--
If you are implying that people, who
hold ham licenses, should be somehow
held to a higher moral standard than
the "common man", then that would
be faulty logic. A ham license is only
a "permit" to use radio, it is not a
"badge of morality".

846. What base C.B. radios would you like to see come back in production?

Newsgroup: rec.radio.cb
Date: 2002-06-07 03:36:28 UTC
From: Mayor <nonelwishtodisclose@nospam.none.ok?>
Message-ID: <0TVL8.26591$092.903791@news1.east.cox.net>
Source record: 126699

Hi, everybody. Here is a chance for everyone to reminisce about your old favorites they no longer make. What radio would you love to see come back into production? It doesn't matter what year the radio was made....50s through the 90s, or whenever....It can be any brand, current or defunct company, it doesn't matter at all. In fact, they don't have to be stellar performers, such as ability to modify for out of band transmit, or super-duper power output. Here is my wish list below, in no particular order.

1. Cobra 2000 GTL---An awesome radio, of course!
2. President P400 (or the other similar radios...Uniden Washington, President Washington and whatever others there may have been.)---A very solid radio...I've had mine since 1989 or so. I wish I had (or could find) a N.O.S. for a back-up rig.
3. Cobra 142 GTL---Another good one.
4. There was one Realistic Navaho (early-mid eighties?) base station I really liked that could have a bunch of extra channels added, but I can't remember the model number. About all I know, was that it was a 40 channel and it might have had SSB too.

I can't understand why they ever discontinued these great radios. It's not like they had old technology in them (i.e. tubes), and, as far as I know, these particular radios were not really problem prone (at least the first three, haha). In fact, most people never had any problems with them (unless an inexperienced person tried to modify them and failed, haha). There's not really a huge selection of great base radios anymore. Yeah, there are some good quality base rigs out there, but not like there was even a mere 10-15 years ago. Of course, I am not saying that the more modern rigs are better than the older tube types, but anyway. Ok...Enough for now. I will have a mobile poll later on. Thanks for any responses.

I'd also like to see the 2000GTL reissued.
Some of the Pierce-Simpson or Royce base models would be neat as well, maybe updated with full frequency range, slightly better selectivity, etc.
I like them ol' wood-grain rigs.
And Stoner stuff... please-
Linus

Is this an appropriate forum for the question? I've called Uniden (they have one for AU), Cobra, Midland, and Ranger, and spent most of the day with Google & Dogpile, and haven't found one. Any suggestions would be appreciated, and TIA.

Hi all

I'm not a regular here, I stopped reading this group ages ago when the discussions were about radio rather than about other people who post on here. So I'm not up to date with the terminology.

What is a keyclown?

cheers
Jack

Yes, and I had to pay someone for the info it is a bitch. but good info cost
money Don't cry Phil

What happened to your friend at aol remember the email from e to you phil
when you had people email you for info on voobner, when I told you

I assume a "keyclown" is one that causes a lot of interference, or purposely keys up over people?? I don't know. I have seen this word several times in the past few months (since I have subscribed to this group). It's the first time I have even heard of this word.

It depends. Predators may give chase, but only if you invade their
space or mess with their cubs. Usually they will just let you know
who's boss and leave you alone, unless they are really hungry. Big
browns will fake a charge or two before they rip your arms off, and
it's best to get down on all fours and back away real slow. The moose
is just plain unpredictable -- it might chase you, it might run away,
or it might just stand there, stare at you and chew its cud. But if a
moose chases you, you might as well run because it's gonna knock you
flat regardless of what you do. Regardless, most animals just keep
their distance, even the big ones, and most people never even know how
close they come to wildlife while hiking.

I wouldn't go that far. It's a simple matter of learning through
observation. Nature is a very good teacher, you just have to be an

equally good student.

It's too simple for a simpleton to handle.

You all have my permission to talk about ANY CB related
topic you want, here or on any other group.

CB related means all topics about CB, legal or otherwise.

If you don't like what someone wrote, ignore it. If you
have something useful to add, do so. Don't whine.

> Jack

Don't let it worry you, Jackson. I have been here thru it all and I am not too sure what is meant. An ongoing pissing contest between the Keyclowns and the Creeping Cadavers so far as I can tell with the latter claiming naming rights.

In your ongoing quest for freqs of various services, might suggest you look up the New Zealand regs that are available on the net. Their CB is lower and there are still Amateur allocations in the 27.1 range. Some of their influence can be seen in the regs from Fiji I believe which is not a huge surprise but it caused a bit of a dust-up here when someone was doing propagation tests.

Now you can help me with another issue. According to http://www.vkham.com Australia and presumably a lot of the area has Marine FM allocations in the 27.66 - 28.0 area with 27.88 listed as the calling and emergency freq comparable to the 156.8 that is more common worldwide. As a by-product of this the US never assigned much if anything in this range which led to it being wide-open for freebanding. Is this really still in use?? It does appear that the channel scheme was updated at the same time and the same way that the VHF FM channels were so on the surface at least it doesn't look like an antiquity.

KFalls, huh Twisted? The good old armpit(read high desert) of Oregon! LOL
Although the university does have some very nice...umm, scenery. Been there
many times. Actually, KFalls itself isn't so bad, just don't go east or
south from there, or you might as well be in west Texas, scenery wise. Not
much there.

i see nothing about this being a "legal cb" only news group. it deals with all aspects of the service. those in which it was intended for and those in which it has actually become.

>Yes it is. It is just as simple to find a more appropriate forum for
>the discussion. And that would have prevented the entire discussion.
>Come to think of it, that would be even simpler, wouldn't it?

I purchased this rig about a year ago but lost my vocal cords to cancer surgery before I could use it. I've also sold or given away most of my other equipment.

The radio has been expanded for operation across 10 - 12 meters by a professional who installed (plugged in) the module. No soldering other mods have been made, although there are lots of them out there. Except for a couple of transmissions into a dummy load in the shop to test the expansion, the radio has never been used or mounted (either base or mobile) and was returned to the original box and resided in my closet for the past year. It is being sold "as new" with box, all mounting hardware and manual.

Since eBay cancelled my auction, I am offering it here for a flat $225.00, and that will include shipping to the lower 48.

You already know what these sell for new...then add the cost of expansion. This is a steal for somebody!

As a bonus, I am also including a new adjustable hump mount I purchased for around $19.00 when I got the radio.

I'll be happy to answer any serious email questions.

Klamath Falls, Eugene, mucho backwoods camping in the Cascades..Crater Lake (mosquito hole)..the clothing-optional hot springs in Umpqua a ways east of (Roseburg???)....Further north up in Washington the weather is too damn damp and wet for me, at least the coast is.

>Probably because it's a rain forest.
Even a small moose can weigh several hundred pounds. Not only that, but they will charge a person for no reason at all.<

One should never run from wild animals..it triggers their predatory instinct to give chase, especially carnivores. 3 words.....climb a tree.

>It depends. Predators may give chase, but only if you invade their space or mess with their cubs. Usually they will just let you know who's boss and leave you alone, unless they are really hungry. Big browns will fake a charge or two before they rip your arms off, and it's best to get down on all fours and back away real slow. <<

LOL! I don't think I'd be getting down on all fours for ANY animals. Only in western Canada have I seen the big browns. I have come across many black bears in the spring with their cubs. I know your bear problem is getting worse because when we were camped where there are browns, the campground not only prohibited food in the tent (a general rule of thumb for campers anywhere regardless of wildlife inhabitants) but prohibited food in the vehicles as well. Matter of fact, it was just last week I saw some pics on the web of some vehicles that bears actually ripped into.

>The moose is just plain unpredictable -- it might chase you, it might run away, or it might just stand there, stare at you and chew its cud. But if a moose chases you, you might as well run because it's gonna knock you flat regardless of what you do. Regardless, most animals just keep their distance, even the big ones, and most people never even know how close they come to wildlife while hiking.<<

Ain't that the honest truth.

>But they won't head-butt a brick wall, so I guess that sets them one step above you on the evolutionary scale.<<

Animals never bothered me, even the wild razorback hogs we hunt. Once again, it's all about communication skills, whether it's with people or animals. It's nice to know your traits are not limited to humans and extend to the creature kingdom.

>I wouldn't go that far. It's a simple matter of learning through observation. Nature is a very good teacher, you just have to be an equally good student.<<

Agreed. Plus animals are nicer to each other. Man is practically the only creature that kills it's own kind for no reason.

>KFalls, huh Twisted? The good old armpit(read high desert) of Oregon! LOL Although the university does have some very nice...umm, scenery.<

Hehehe! Yea..it does...really kind. Stayed in KF overnight after a ride south and before we cut over to the coast heading to the "Lost Coast".....talk about your serious wilderness..

> Been there many times. Actually, KFalls itself isn't so bad, just don't go east or south from there, or you might as well be in west Texas, scenery wise. Not much there.<<

Heheh! Gotta admit, I really liked what I saw in west TX. It might as well be another state compared to east Texas. Never spent much time in Texas other than passing through and a night or two off the interstate and a few short stops here and there, but I will in the future. When my little brother graduated college he went into the service and then the feds made him a good offer. He's now in Dallas and I hope to make it there by next year. Wanted to go this year but it's not in the cards..I have to go north and nw this year, some work, some play.

Sure you can. Freebanders do it all the time. It's no more illegal to
go above 27.995 than it is to go above 27.405 or below 26.965.

Source record: 126814

Saw this on the transport trucking site.

You have to understand something when dealing with most hams (I stress most not all)

1. They need to get a life, I mean who the hell sits in a basement at 3:00am huddled around a radio telling
a fellow no life geek (and at the age of 45 still living with mom and dad) that he just got ham life magazine
and it details how to hook up a relay to his dads lawn mower so he can talk to another hermit in South
Zimbabwe.

2. Have you ever been in a ham land store. Most of the hermits are a good 400 pounds or more and you'll
hear them talking to another hermit how he was talking to another hermit in the Himalayas on how he
prevents bedsores on his butt after sitting all night monitoring skip around the world. The clerk liked it when
I needed a new Astatic mic and asked me if I was a ham and my reply was "No I have a life, wife and a
real job.

3. Also who else would be driving around in his 73 Plymouth duster at 2:00 am with radio equipment trying to
catch working AMERICANS making a living and keeping this country moving while trying to talk to FELLOW
AMERICANS WORKING and trying to keep the boredom at bay. Of course a large percentage of hams are boring themselves and cannot make the connection..

4. Most non trucking hams also don't understand that most truckers wouldn't even own a radio if he or she
wasn't in trucking and don't have a radio in his or her own car.

Now of course I run a legal radio set up : Uniden 76 (no tune or peak) Monkey made antenna and a small
X-force 400 amp :)

Interestingly enough Dick, I worked in Southwark (which borders the
River Thames) for seven years. As a matter of interest there was an
old prison very close to the River, and it has been converted into a
pub, however, a great deal of the prison still survives. If you
misbehave yourself in the pub, I Suppose they can lock you up for the
night...without the hassle of calling the police ;-)

BTW, Pentonville is in North London, and it has a very large prison
also, only this one is most certainly not a pub :-(

Best Wishes

It depends on how many watts you are running if it is under a few Kw the static Ball is useless, Usually when there is Big wattage 10 Kw or higher applied you need a round surface on top or a corona forms (similiar to a arc welders flash) when you key up.

Chances are if ebay cancelled your auction, you probably just put it in the
wrong category (if it was in the 'CB' category, then that's probably why).
You can just put it in the 'Radio Equipment' category, and specify that it
is illegal to use it on 11 meters, but can be used on the 10 meter band by
licensed hams.
That'll usually satisfy ebay. They cancel any auctions for Linears or other
radios that have been modified to have more than 4 watt output. That sounds
like a good deal though, if I had the cash I might have taken you up on it.
Good luck.
Pyro.

I have yet to see this phenomenon, people incorrectly call them static
balls,
do you really think a little ball on the antenna will make any difference
that the human ear could detect?

You caught it. Isn't every real estate developer who names the streets in
his subdivision after British prisons.

I once knew a fellow who had refurbished an old house in a Missouri town
in Steamboat Gothic and was very proud of his address: #2 Virgin Alley.
Care to guess the history of that house??

Sparky,

I'm surprised that you don't see this as a win-win situation.

The conversion being considered is quite complicated technically and mechanically; and definitely NOT an easy conversion!

If the 'psuedo-ham'/CB'r tries the conversion and fails, you will have one more high power amplifier off the band.

On the other hand, if that 'psuedo-ham'/CB'r tries the conversion and is successful, he would have proven himself to be more technically competent than 90% of the licensed HAMs who are strictly 'appliance' operators, and you would be wise to recruit him.

Since the HAM Radio Service justifies it's existence by the fact that it is supposed to be this countries back up communications system in the event of war or national disaster; I would prefer to have the more technically competent person be somewhere near the damaged equipment to get it functioning again; and if he could repair it I don''t think anyone would care if he was a licensed operator or not.

Regards,

Dennis O.

Since you want to pick this to death, does CB radio permit the use of amps? No. As soon as you transmit with an amp, the transmitter is no longer being used within the definition of CB radio: Therefore, there is no such thing as a CB amp. Satisfied? Good.

If you want to consider Scottsbluff, Nebraska as in the Midwest.

Here's a bit of Trivia......

Dig out your old Popular Electronics Magazines from the late 60's or anywhere in the 70's and look up the ads for NRI (National Radio Institute) training.

Featured in most of the ads was NRI's most successful student; Mr. Delaney.

As in Delaney and Adams; or D&A Mfg..

It usually showed him standing in front of his van on the top left page of the two page ad for NRI.

He made good amplifier equipment that sold for a fair price and met the FCC requirements for that era, but the company fell apart after he died.

Regards,

Dennis O.

If the amp is converted, at the very least it will increase the power
output; at the worst, it will splatter the band from DC to daylight.
But when they are determined, you can bet that they will try the
conversion -- just the fact that people have done it already is proof
of that.

> On the other hand, if that 'psuedo-ham'/CB'r tries the conversion and is
>successful, he would have proven himself to be more technically competent than

I don't recruit anyone because I'm not a ham (gee, haven't I said that
before?). But if he isn't successful, what does he do for power after
that he has spend a wad? A cheap splatter-box?

> Since the HAM Radio Service justifies it's existence by the fact that it is
>supposed to be this countries back up communications system in the event of

Really? The last line of communication for the country depends on
radio amateurs? That may have been true 50 years ago, but today I
don't think so.

> I would prefer to have the more technically
>competent person be somewhere near the damaged equipment to get it functioning

>licensed operator or not.

If someone wants to learn about radio technology, fine, there are many
ways -- LEGAL ways -- he can do that. But I don't think you can use
the theoretical possibility of a war and/or national disaster to
justify illegal operation.

Thank you Dennis, you tripped a few triggers. This area at one time had a lot of electronic companies including the guy who built the stuff for Muzak. World Radio Labs of Globe King fame became Galaxy with some connection to Hy-Gain that was in Lincoln. Like most US electronics it just faded away but I remember D&A.

Scottsbluff is about 400 miles west of here and is closer to being suburban Denver these days. It was a landmark on the Oregon Trail. If you grew up here you always wondered how Ohio was 'midwest' but you

finally followed the newspaper and referred to the area as the Midlands. Somehow Great Plains didn't cut it; Omaha is both tree-infested and very hilly. Lincoln is on the edge of the prairies so we refer to the Nebraska capitol as the Penis of the Plains; makes an interesting sight off of I-80 as it skirts the hills to the north of Lincoln.

Dick N BK, Omaha NE. NebraskaLand, where the East peters out.

1. Who is "us"?

2. For the second time today, I'm not a ham.

3. You make a very good point: Some illegal operators have ham
licenses. But are you suggesting that illegal operation be permitted
in the CB newsgroup only if the operator isn't a ham? Scott, I don't
care if they have a license to grow daisies on their ass. If it ain't
legal, it ain't CB.

4. If you think you are being harassed, quit reading the newsgroups
and get a life.

if you had a actual radio and spent time listening to it you'd hear that 99.9% of the ten meter intruders are truck drivers thats unaware of where there transmitting at and just looking for a clear channel and happen o land on ten meters. i'd say thats more fault of the hams that help design and import these rigs instead of the freebanders who know better and stay below 27.995. nobody wants to get caught or be in trouble and everybody realize the easiest way to stay toruble free is to keep away from ten meters. the only ones i hear here are the ones that dont know better and are usually talking to another driver 10 or so miles down the road.

Your are correct, Australia has an odd marine spec on 27mhz, but its AM not
FM. Uses listed below. I was involved with our local voluntary coastal
patrol so can tell you that this band is very much in use. It tends to be
used by small leisure craft. 27mhz does not require a license or operators
exam and the radios are very cheap. It serves those who don't have the time
or money to get a VHF ticket, but want a better service than regular CB or
mobile phone. It suffers a little from SSB interference when the propagation
is running, but isn't to bad as local pirates know to keep clear of these
ones.
Hope that's useful
cheers
Jack

Marine CB
4 watts AM
only for safety communications, no chat
no license required
27.680 ch68 commercial vessels
27.720 ch72 commercial fishing vessels
27.820 ch82 commercial fishing vessels
27.860 ch86 alternative calling
27.880 ch88 emergency and calling
27.900 ch90 ship to shore (clubs and groups)
27.910 ch91 ship to shore (clubs and groups)
27.940 ch94 club events
27.960 ch96 ship to ship
27.980 ch98 surf lifesavers

All the blame-shifting polemics aside, you are for the moment correct and I will admit to having certain pangs of pseudo-guilt with the photo project for just that reason. But enforcement requires the occasional crucifixion, just ask Pilate. It is in fact one of several reasons we are not sharing with the FCC at the moment.

At the same time there are few long-time 10 meter ops who have not been engaged in a local bull session at the dark of the spots and had some good buddies break in for a radio check. It goes back to the crystal-control days so it is nada new. One nite in St. Louis in the 70s we held an improptu ceremony and assigned WB5QLF and WB5LID to two yokels from Arkansas. And this was at 28.600.

There was at least one CB pub that advocated wandering into 10 and 12 and saying howdy. Apparently these guys did not realize that Amateur rules do not allow us to talk with pirates. And when some jackass asks for your 10-10 number this might be a little disconcerting anyway; callsigns be damned give me your number for the contest.

With the spots up, Tim, it is mostly truckers but this state of affairs will not last forever.

Well I for one learned something because the channels sure looked like 5
kHz FM and that 27.91 was not a typo.

As I noted the U.S. did not allocate anything there although there was an
idea to run CB up to 27.995 using the same channel numbers BTW but on the

fives. As the whole CB caper was run by what appeared to be summer interns at the FCC it is hard to reconstruct the sequence of events.

And the freebanders I hope learned the truth of the old WW2 line, 'Loose Lips Sink Ships'.

Thank you, sir.

Well Tim, like it or not, "Citizen's Band radio" is a legally defined term for a legally authorized radio service. But let's take this from a grade-school approach so you can understand:

POP QUIZ!!!

Given: CB radio is a radio service that allows license-free operation of FCC approved devices which are limited to 40 specific channels from 26.965 to 27.405MHz, transmitting no more than 4 watts AM and 12 watts SSB. While operating a CB station, can the operator:

1. transmit on 27.555MHz?

2. transmit 400 watts of RF power?

3. transmit using supressed-carrier modulation?

4. use a transmitter that is not approved for the CB radio service?

Only country (to my knowledge) that has CB so high, is the UK which has the
40 FCC channels and 40 at 27.60125 to 27.99125, 10khz steps, FM only.

Romania goes to 27.660, Brazil to 27.605.
Germany and Hungary have extra channels down below the FCC 40.

Australia also has a hand held only service at-

Hand phones
Hand helds only
4 watts AM
5 watts USB
27.550
27.560
27.580 Bush fire fighters only
27.590
27.620
27.660
27.760

A radio with both the expo kit and MB8719 could be modified for
26.365-28.495, however you would need to do some broadbanding for sure, it
will never work just stock. If you now get 26.525 - 27.845 and all the
channels actually work, you're lucky. I don't think it's worth the effort to
go for more than that.

The history of CB in the U.S. is a tortured one and was done at a time when the technical brains of the Commission were off frying much larger fish so my suspicion that it was done by rookies and summer interns is not unbelieveable. Originally it was the 11-meter ham band plus 27.255 which was something of a garbage freq and may still have industrial hash on it for all I know. It was to be expanded but stopped at 40 from the original 23, reputedly because of what was by the 1960s something of an urban legend -- that radiation from the local oscillators of the receivers would cause interference in the upper channels. There may well have been other reasons for it to have stopped at 40. It has, of course, become something of an international embarassment to the U.S. so don't look for any expansion in the future.

There is no channel 1 on American TV sets. This was to have been 44-50 MHz but was never issued supposedly because of the local oscillators in the receivers would have been at 71 MHz which is about where the sound carrier of TV Channel 4 is located. In 1947 this was probably true but wasn't 15 years later. In those days the 25-28 region was considered

trash and the TV i.f.s were in the 21-27 range. This episode was probably the legend that did it although there are conspiracy theorists that relate it to the tussle between David Sarnoff at RCA and Edwin Armstrong whose FM was in the 44-56 range prior to WW2. The current 88-108 was allocated internationally in 1947 and it was held that having killed FM Channel 1 was no longer needed to stop Armstrong and it was not all that good anyway.

Life has obviously moved on in intervening years. At the time, FM at its narrowest was in 50 or 60 kHz channels. You can see where the VHF marine channels were split when the deviation was reduced from 12-15 kHz to 5 and now closer to 2 kHz on most services. One of the advantages of coming late to the table is the ability to use FM for personal services and the 2kHz swing is now normal where it violated Armstrong's FM theory until actual usage and some better detectors made it work. There are several UK groupies who will tell you that there is not a lot to choose between AM idiots and FM nincompoops, however; both react to limiters like Dracula to a garlicwood cross.

> equipment who are they harming?

Not true, and you know that. This case is clear cut. There are still many businesses users on those channels, and there is nothing in the rules that says they have to leave either! So the idiots running the high power on the MURS license free channels are in fact interfering with the current legitimate users of those channels. The power is deliberately kept at the 2 watt level, or less in many cases, to limit any interference to other users on the same channel.

For example there are two fast food outlets, and a "Laser Quest" Laser tag game hall, all within a couple of miles of my apartment. All use the same MURS channel frequency. None of them have a problem because the TX power is kept very low. You get more than a quarter mile away and you can't even hear them any more. Now if you get some idiot running 50 watts, by using a modified Ham 2m rig illegally on MURS, which could easily cover a 20 to 30 mile radius all round, the interference problem becomes huge.

> Nobody.

Talk about being out of touch with reality. I'll bet you didn't even think about the problem.

Oh, heck. Since you're throwing something out for 'general information'
I thought I'd throw this in .... enjoy!

==>NEW TRIAL DATE SET IN FLORIDA INTERFERENCE, UNLICENSED OPERATION CASE

June 10, has been set as the newest federal trial date in the case of a
Florida man arrested two years ago for interfering with Amateur Radio
operations and for transmitting without a license. William Flippo, of
Jupiter, faces four counts of operating without a license and four
counts
of deliberate and malicious interference to a licensed service.

Whether the trial actually will commence remains in question, however.
The
case was to have gone to trial more than a year ago but was twice
postponed after Flippo argued successfully that serious health problems
would prevent him from participating. According to a source familiar
with
the case, Flippo failed to persuade a US magistrate this week that he
was
incapable of standing trial, and the trial date was set.

Flippo, 59, was taken into custody by federal authorities in July 2000.
He
remains free on bond. As a condition of his release, Flippo has been
prohibited from making any radio transmissions and from contacting any
witnesses in the case. Criminal charges going to trial this month cover
violations allegedly committed between June 1999 and April of 2000. Each
count carries a maximum penalty of one year in prison and a $10,000
fine.
The case will be heard in US District Court in West Palm Beach.

Flippo already faces a $20,000 fine levied in 1999 for unlicensed
operation, willful and malicious interference to Amateur Radio
communications, and failure to let the FCC inspect his radio equipment.
In
January 2000, the FCC gave Flippo 30 days to pay and referred the matter
to the US Attorney after he failed to do so and the interference
complaints continued.

A year ago in state court, Flippo was found guilty of criminal mischief
in
a case related to his radio activities. Palm Beach County Judge Charles
Burton sentenced Flippo--known in CB circles as "Rabbit Ears"--to one
year's probation and ordered him to dispose of any radio equipment in
his

possession. That case stemmed from a charge that Flippo had rammed his vehicle into the car of a local amateur who was assisting an FCC agent in
tracking down the malicious interference attributed to Flippo.

Personnel from the FCC's Tampa District Office followed up on complaints from amateurs that Flippo had regularly interfered with amateur operations, especially on 10 and 2 meters. Commission personnel visited the Jupiter area at least twice in 1999, and the FCC reports it was able to track offending signals to Flippo's residence.

.....

end copy

.....

Why don't you get a bigger linear? Oooops, I mispoke. Why don't you get a bigger amplifier (class C, of course)?

73 from Rochester, NY
Jim

ps - heck, Aaron, if someone can fling away at the hammies, go ahead and make a post on this.

===

The "ruination" happened long before I had even been on the Internet.
All I have done is reply to the personal attacks which YOU made on me.

But you know that, you are just trying to pass the blame.
I am presently signed up to 8 newsgroups and have posted to more
than that, the only one with all the problems is the one YOU have
been on for the last few years. All the others are fine, people are helpful
and friendly.

===
> >Given the chance, he will do the same to this group...
>
> Balderdash.
===

So, why do you insist on cross posting to the UK group when
the topic is not CB (let alone UK CB) and you are not in the UK?
Simple, you insist on spreading your BS to that group.

===
> Oh, rubbish. You have been crapping in our
===

Stop right there...
YOU DO NOT OWN "REC.RADIO.CB".
It is not "antikeyclown.radio.cb" or "voobner.radio.cb".
It is not even "usa.radio.cb".

If you want your own CB newsgroup, get off your ass and start one.

===
> rec.radio.cb garden for months.
> The moment I set foot into yours, you shriek like a frightened old woman.
===

Ah, but the goup is clearly named as UK and CB.
Like I say, you want your own group, get off your ass and create one.
But we all know how you dislike any positive action, preferring to sit
behind the keyboard insulting people.

===
> Sorry, it wasn't me.
===

The IP number matched your's on the newsgroup at that time.
You made a slip up... learn to live with it.

===
How about posting your "evidence"
===

I already have, you are losing the plot, Aagent Aaron... do
try to keep up, old bean. The post to which you replied even
stated what the evidence was... you really are losing it, Aagent Aaron.

Now, how about your evidence of the accusations you made
regarding me... huh?

==
> >I know we do not all agree on all subjects (who does), but this group

No. As soon as the radio deviates from the definition of CB radio it
is no longer CB radio.

It is -your- thought process that is screwed up because your
modification doesn't cause a change in the definition of a car. Here's
an analogy that fits: if someone removes the pedals from a moped, it's
no longer a moped. Does that clear it up for you?

A beautiful, voluptuous woman went to a gynecologist. The doctor took one look at her, and all his professionalism went out the window.
He immediately told her to undress. After she had disrobed, the doctor began to stroke her thigh. Doing so, he asked her, "Do you know what I'm doing?" "Yes," she replied, "you're checking for any abrasions or dermatological abnormalities." "That is right," said the doctor.
He then began to fondle her breasts. "Do you know what I'm doing now?" "Yes," the woman said, "you're checking for any lumps or breast cancer." "Correct," replied the shady doctor.
Finally, he mounted his patient and started having sexual intercourse with her. He asked, "Do you know what I'm doing now?" "Yes," she said. "You're getting herpes, which is why I came here in the first place

963. The honeymoon.....

Newsgroup: rec.radio.cb
Date: 2002-06-08 11:30:22 UTC

A couple was on their honeymoon, lying in bed, about ready to consummate their marriage, when the new bride says to the husband, "I have a confession to make, I'm not a virgin."

The husband replies, "That's no big thing in this day and age."

The wife continues, "Yeah, I've been with one guy."

"Oh yeah? Who was the guy?"

"Tiger Woods."

"Tiger Woods the golfer?"

"Yeah."

"Well he's rich, famous and handsome. I can see why you went to bed with him."

The husband and wife then make passionate love. When they get done, the husband gets up and walks to the telephone. "What are you doing?" asks the wife.

The husband says, "I'm hungry, I was going to call room service and get some food."

"Tiger wouldn't do that!" She claims .

"Oh yeah? What would Tiger do?"

"He'd come back to bed and do it a second time."

The husband puts down the phone and goes back to bed to make love with his wife a second time. When they finish, he gets up and goes over to the phone.

"What are you doing?" She asks.

The husband says, "I'm still hungry so I was going to call room service to get some food."

"Tiger wouldn't do that." Again she claims.

"Oh yeah? What would Tiger do?"

"He'd come back to bed and do it a third time."

The guy slams down the phone and goes back to bed and makes love to his wife a third time. When they finish he's tired and beat. He drags himself over to the phone and starts to dial.

The wife asks, "Are you calling room service?"

"No! I'm calling Tiger Woods to find out what's par for this damn hole!"

Once upon a time, there once was a traveling salesman who's wife was a well known sex addict. But because the man could not be home all of the time, he often worried about his wife's faithfullness. He had noticed that she had been eyeing the young neighbor boy who cut their lawn recently. So one day the man decided to try to do something about this. After work the man entered a sexual aid shop and asked the owner to show him the selection of dildos.
"Why yes, of course." said the owner, "We have a very wide selection."
But after looking for quite a long time, the man just did not find anything that satisfied him.
"Well, maybe I have just what you need." remarked the owner, "Wait here."
And with that, the owner ran into the back and started digging around for quite some time. After about twenty minutes, the owner finally came out carrying a strange, rectangular box with ancient writing all over it. He set the box down on the counter and opened it for the man. Inside, resting on a bed of satin, la lay an ancient wooden dildo.
"Wow, that pretty neat." said the man, "But what's so special about it?"
"This is the Voodoo dick." remarked the owner, "Watch."
Then the owner commanded, "Voodoo dick, rise."
All of a sudden the dildo rose and hovered in front of the man's face.
"Voodoo dick, door."
The dildo then flew to the door and started pounding on it like a jackhammer.
Five minutes later, when the door was nothing but a pile of splinters, the owner finally commanded, "Voodoo dick, box."
The dildo stopped suddenly and zipped back to rest in its box. The man, being in amazement, pronounced, "My god, this thing is incredible. I must have it. How much is it?"
"Oh no, I cannot sell it to you. It is a family hierloom and is not for sale."
"Well, I must have it. I'll give you $200 for it." demanded the man.
"No, not for sale."
"$500."
"No, I cannot."
"$700."
"I am sorry."
"$1000."
"Well, ok."
So the man took the dildo home and presented it to his wife, "When I am gone and you start to get hot and horny, all you need to do is say 'Voodoo dick, cunt' and it will do the rest." explained the man.
The next day the man had to leave for his business trip. He was not gone more than thirty minutes when his wife started to get that feeling

again. She picked up a magazine to read and noticed that their lawn was being mowed, but wanting to stay faithful to her husband, she decided to try her new toy. She ran to the bedroom, fell onto the bed, opened the box, and commanded 'Voodoo dick, vagina'.
With that, the Voodoo dick started to pound away at her vagina. The wife thought that this was incredible and was having one orgasm after another. An hour passed and she was still orgasming like crazy. Another hour passed and she was begining to tire and getting a bit sore. But she realized that she did not know the command to stop the Voodoo dick. She decided that she had better get help as soon as she could. So she got into her car and raced to the hospital.
While speeding there,she flew past a cop who then proceeded to pull her over.
"Why in the hell were you driving so crazy?" asked the officer.
"Well officer," answered the wife, "I have this Voodoo dick in my vagina, and I dont know how to stop it."
To which the officer responded, "Voodoo dick, my ass!"

>group up :-(

I guess that depends on your point of view, Toxic. The way I see it,
this newsgroup was already screwed up by all the talk of amps and
freebanding. It is also one of the few newsgroups where violation of
federal law regularly occurs. If someone want's to change that for the
better, that doesn't sound like someone screwing it up, does it? Or
are you thinking along the lines of Train Von Trapp who is proud to be
someone that violates laws (except in his own neighborhood because he
might get caught)?

>Not content with stirring things up here, he has now started on
>uk.rec.radio.cb.

So? UK CBers post here, so why not the other way around?

>From the ammount of time he appears to spend on this Ng, it is
>patently obvious he is unemployable, resides in a trailer park and
>lives off social security.

From the amount of whining you keyclowns do about Voobner, it is
"patently obvious" that your characterizations are derived from
personal experience.

>Very sad really :-(

No, not really. If someone is going to stand up for what they think is
right, the expected response from the opposition is to discredit him
in any manner possible. Your demeaning speculation of his lifestyle,
right or wrong, is only verification that his actions are being
effective. Very good really :-)

Once there was a beautiful woman who loved to work in her vegetable garden, but no matter what she did, she couldn't get her tomatoes to ripen. Admiring her neighbor's garden, which had beautiful, bright red tomatoes, she went one day and inquired of him his secret.

"It's really quite simple -- twice each day, in the morning and in the evening, I expose myself in front of the tomatoes and they turn red with embarrassment."

Desperate for the perfect garden, she tried his advice and proceeded to expose herself to her plants twice daily...

Two weeks passed and her neighbor stopped by to check her progress. He asked if she had had any luck with her tomatoes.

"No" she replied, "but you should see the size of my cucumbers!!!

<< Subject: Getting Old

Sad day when you realize you are all grown up.
1. Your potted plants are alive. And you can't smoke one of them.
2. Having sex in a twin-sized bed is absurd.
3. You keep more food than beer in the fridge.
4. 6:00 AM is when you get up, not when you go to sleep.
5. You hear your favorite song on an elevator.
6. You carry an umbrella. You watch the Weather Channel.
7. Your friends marry and divorce instead of hookup and breakup.
8. You go from 130 days of vacation time to 7.
9. Jeans and a sweater no longer qualify as 'dressed up.'
10. You're the one calling the police because those darn kids next door don't know how to turn down the stereo.
11. Older relatives feel comfortable telling sex jokes around you.
12. You don't know what time Taco Bell closes anymore.
13. Your car insurance goes down and your car payments go up.
14. You feed your dog Science Diet instead of McDonald's.
15. Sleeping on the couch makes your back hurt.
16. You no longer take naps from noon to 6 p.m
17. Dinner and a movie - The whole date instead of the beginning of one.
18. Eating a basket of chicken wings at 3 a.m. would severely upset, rather than settle, your stomach.
19. You go to the drugstore for Ibuprofen and antacids, not condoms and pregnancy test kits.
20. A $4.00 bottle of wine is no longer 'pretty good stuff.'
21. You actually eat breakfast foods at breakfast time.
22. "I just can't drink the way I used to," replaces "I'm never going to drink that much again."
23. Over 90% of the time you spend in front of a computer is for real work.
24. You don't drink at home to save money before going to a bar.
25. You read this entire list looking for one sign that doesn't apply to you!

Definition of the SuperBowl
If 10,000 CB'er's are on the SuperBowl

Source record: 126878

Young King Arthur was ambushed and imprisoned by the monarch of a neighboring kingdom. The monarch could have killed him, but was moved by Arthur's youth and ideals. So the monarch offered him freedom, as long as he could answer a very difficult question. Arthur would have a year to figure out the answer; if, after a year, he still had no answer, he would be put to death.

The question: What do women really want? Such a question would perplex even the most knowledgeable man, and, to young Arthur, it seemed an impossible query. But, since it was better than death, he accepted the monarch's proposition to have an answer by year's end.

He returned to his kingdom and began to poll everybody: the princess, the prostitutes, the priests, the wise men, the court jester. He spoke with everyone, but no one could give him a satisfactory answer. Many people advised him to consult the old witch--only she would know the answer. The price would be high; the witch was famous throughout the for the exorbitant prices she charged.

Finally the last day of the year arrived and Arthur had no alternative but to talk to the witch. She agreed to answer his question, but he'd have to accept her price first:
The old witch wanted to marry Gawain, the most noble of the Knights of the Round Table and Arthur's closest friend!

Young Arthur was horrified: She was hunchbacked and hideous, had only one tooth, smelled like sewage, made obscene noises... etc. He had never encountered such a repugnant creature. He refused to force his friend to marry her and have to endure such a burden.

Gawain, upon learning of the proposal, spoke with Arthur. He told him that nothing was too big a sacrifice compared to Arthur's life and the preservation of the Round Table. Hence, their wedding was proclaimed, and the witch answered Arthur's question thus:

What a woman really wants is to be in charge of her own life. Everyone instantly knew that the witch had uttered a great truth and that Arthur's life would be spared. And so it was. The neighboring monarch granted Arthur total freedom.

What a wedding Gawain and the witch had! Arthur was torn between relief and anguish. Gawain was proper as always, gentle and courteous. The old witch put her worst manners on display, and generally made everyone very uncomfortable. The hour approached. Gawain, steeling himself for a horrific experience, entered the bedroom. But what a sight awaited him! The most beautiful woman he'd ever seen lay before him! The astounded Gawain asked what had happened. The beauty replied that since he had been so kind to her when she'd appeared as

a witch, she would henceforth be her horrible, deformed self half the time, and the other half, she would be her beautiful maiden self.

Which would he want her to be during the day, and which during the night? What a cruel question! Gawain pondered his predicament. During the day, a beautiful woman to show off to his friends, but at night, in the privacy of his home, an old witch? Or would he prefer having by day a hideous witch, but by night a beautiful woman with whom to enjoy many intimate moments?

What would you do? What Gawain chose follows below, but don't read until you've made your own choice.
> > >
> > >
> > >
> > >
> > >
> > >
> > >
> > >
> > >
> > >
> > >
> > >
> > >
> > >
> > >
> > >
Noble Gawain replied that he would let her choose for herself. Upon hearing this, she announced that she would be beautiful all the time, because he had respected her enough to let her be in charge of her own life.

What is the moral of this story?

The moral is: if a woman doesn't get her own way, things get ugly!

Definition of the SuperBowl
If 10,000 CB'er's are on the SuperBowl
then only 1000 can be heard some of the times

Did you hear about the Kentucky red neck who passed away and left his entire estate in trust for his beloved widow? The only catch is that she can't touch it until she's 14.

How do you know when you're staying in a Kentucky hotel? When you call the front desk an say, "I've got a leak in my sink," and the person at the front desk says, "Go ahead."

An Arkansas State trooper pulls over a pickup truck on I-40 and says to the driver, "got any ID?" The driver says, "'Bout what?'

Two Mississippians are walking toward each other, and one is carrying a sack. When they meet, one says, "Hey Tommy Ray, whatcha got in th' bag?' "Jes' some chickens." If I guesses how many they is, kin I have one?" "Shoot, if ya guesses right, I' give you both of 'em!" Okay......Ummmmmmm ....five?"

An Alabamian came home and found his house on fire. He rushed next door, telephoned the fire department and shouted, "Hurry over here muh house is on fahr!" "Okay," replied the fireman. "How do we get there?" "Shucks, don't you fellers still have those big red trucks?"

Why do folks in Kentucky go to R-rated movies in groups of 18 or more? Because they heard 17 and under aren't admitted.

Billy Bob and Lester were talking one afternoon when Billy Bob tells Lester, "Ya know, I reckon I'm about ready for a vacation. Only this year I'm gonna do it a little different. The last few years, I took your suggestions as to where to go. Three years ago you said to go to Hawaii. I went to Hawaii and Betty Sue got pregnant. Then two years ago, you told me to go to the Bhahamas, and Betty Sue got pregnant again. Last year you suggested Tahiti and darned if Betty Sue didn't get pregnant again." Lester asks Billy Bob, "So, what you gonna do this year that's different?" Billy Bob says, "This year I'm taking Betty Sue WITH me."

Ida Mae passed away and Bubba called 911. The 911 operator told Bubba that she would send someone out right away. "Where do you live?" asked the operator. Bubba replied, "At the end of Eucalyptus Drive." The operator asked, "Can you spell that for me?" After a long pause, Bubba said, "How 'bout I drag her over to Oak Street and you pick her up there?"

Know why they raised the minimum drinking age in Alabama to 32? They wanted to keep alcohol out of the high schools.

What do they call reruns of "Hee Haw" in Mississippi?..... Documentaries.

Where was the toothbrush invented? Kentucky. If it was invented anywhere else, it would have been called a teethbrush.

Did you hear about the $3,000,000 Indiana State Lottery? The winner gets $3 a year for a million years.

Why did O. J. Simpson want to move to West Virginia? Because everyone has the same DNA.

A new law was recently passed in North Carolina so that when a couple gets divorced, they're still brother and sister.

What do a divorce in Alabama, a tornado in Kansas, and a hurricane in Florida have in common? Either way, somebody's fixin' to lose a trailer.

Definition of the SuperBowl
If 10,000 CB'er's are on the SuperBowl
then only 1000 can be heard some of the times
& only 100 can be heard most of the times
& only 10 can be heard all the time
This is a great example why the bowl is not for the weak!

978. ICECOLD JOKE OF THE SATURDAY

Newsgroup: rec.radio.cb

An Irishman with a bad leg hobbled into a restaurant one afternoon. He painfully sat down at a booth and asked the waitress for a cup of coffee.

Irishman looked across the restaurant and asked, "Is that Jesus over there?". The waitress nodded so the Irishman told her to give Jesus a cup of coffee too.

The next patron to come in was an Englishman with a hunched back. He shuffled over to a booth and asked the waitress for a glass of hot tea.

He also glanced across the restaurant and asked "Is that Jesus over there?". The waitress nodded so the Englishman said to give Jesus a cup of hot tea too.

The third patron to come into the restaurant was a Redneck. He swaggered over to a booth, sat down and hollered "Hey there sweet thing, how about gettin me a cold glass of Coke!". He too looked across the restaurant and asked "Is that God's boy over there?". The waitress nodded so the Redneck said to give Jesus a cold glass of coke too.

As Jesus got up to leave. He passed by the Irishman and touched him and said "For your kindness, you are healed. The Irishman felt the strength come back into his leg and got up and danced a jig out the door.

Jesus also passed by the Englishman, touched him and said, "For your kindness, you are healed." The English man felt his back straightening up and he raised up his hands, praised the Lord and did a series of back flips out the door.

Then Jesus walked towards the Redneck. The Redneck jumps up and yells, "Hey, man don't touch me......I'm drawin disability!!!!!"

Definition of the SuperBowl
If 10,000 CB'er's are on the SuperBowl
then only 1000 can be heard some of the times
& only 100 can be heard most of the times
& only 10 can be heard all the time
This is a great example why the bowl is not for the weak!

Dweebo, George made no mention of RMS watts or Bird watts, he even posted the specs on the wilson 500 that say 2000 watts, Not keyclown watts If I am not mistaken, george did say 2000 watts. If that is as technical as you can get assuming facts and such. I say stick to your porn site and drugs your much better at that than you are with radios.

Good subject:

I would like to see a General Radiotelephone Super MC-11A,
and the General Radiotelephone SSB and AM Radio, the SB-72.

If you have one of theses radio's I am intrested......

But would settle for a remake of the Corba 2000, with some Bitchen round
Meters.

Ah the memories.....

Jay in the Great Mojave Desert, ... just down the road ah ways from the
fillin station.

Quite a bit. Obviously you have never tried to hit a moving target, or even a long-range target. You will learn about muzzle velocity, wind speed, air density, aerodynamic cross-sections, etc. But of course you don't need to shoot people to learn about those things, and neither do you need to be a pirate to learn about radio electronics.

Then they weren't mopeds. Where do you think the "-ped" comes from in
"moped"? But if you think differently, maybe you can point out the
Hawaii state law that allows mopeds without pedals.

BTW, a lot of misinformation gets spread because of the underground activities of illegal radio. Like the importance of bird watts, supressed-carrier modulation, and "swang". A lot of important information gets ignored in the same way, like the role of modulation limiters, the causes of band noise, and the immutable concept of the radio spectrum as a limited resource. And that's the truth, "like it or not".

It took me a couple minutes, but you are absolutely right -- Hawaii
does not require pedals on their mopeds! Regardless, Hawaii has no
definition for CB radio that is different from the FCC's definition,
and your analogy is still wrong.

>A bunch of us crazy CB'ers having an impromptu coffee break,

Being British, I have no axe to grind with this Ng, however, as Cb'er
who regularly enjoys reading "some" of the postings, may I suggest
rec.radio.cb appoints itself a moderator...and fast. It would appear
Mr Voobner and his associates are intent on totally screwing this
group up :-(

Not content with stirring things up here, he has now started on
uk.rec.radio.cb.
From the ammount of time he appears to spend on this Ng, it is
patently obvious he is unemployable, resides in a trailer park and
lives off social security.

Very sad really :-(

Best Wishes

Hello,

I know that a modulator such as a JB-12 increases your modulation. What I am wondering is how do they work? I have seen both tube type and solid state modulators. Which work better? What is the difference between a modulator and a linear amplifier?

If there is an amplifier guru out there, please give me a technical explanation of how modulators work. I have always been curious about this.

Thanks

Phil

Hello,

You did not indicate what frequency range that you want your generator to cover. I have recently built a signal generator that covers 0 - 40 Mhz in 0.0291 Hz steps!

It uses the Analog Devices AD9850BRS DDS synthesizer IC. It is priced at around $23.00 USA for quantites of one. If you are interested, go to http://www.analog.com and download a data sheet on the AD9850.

The only additional support chips required are two 74HCT574's and a 120.00 or 125.000 Mhz crystal oscillator, and this will allow you to load frequency data as a 32 bit word via your computer's parallel printer port to the DDS IC. The data sheet has a schematic for this arrangement. Also at Analog's web site you can download a windows based program (with source code!) that is used with their evaluation board to communicate with the DDS IC through the parallel port.

I am putting together a few dozen kits for a local electronics class for the students to build and experiment with Direct Digital Synthesis.

Regards,

Phil

The Realistic TRC-415 uses a LC7132 PLL which is one of those not easily modifiable ROM based chips. The chip accepts direct VCO input in the range of 13-16 Mhz depending on whether you are in TX or RX. The 10.240 Mhz crystal is used as the reference for the PLL and for the second RX mixer.

In receive mode the T/R pin on the PLL is pulled high which selects a VCO division in the range of 3254 (Ch 1) to 3342 (Ch 40). The VCO generates a frequency in RX mode from 16.270 Mhz (Ch 1) to 16.710 Mhz (Ch 40). The 16 Mhz VCO is mixed with the 27 Mhz RF in the 1st RX mixer to give a first IF

of 10.695 Mhz. The 10.695 Mhz IF is mixed with the 10.240 Mhz PLL reference crystal to give a second IF of 455 Khz.

In transmit mode the T/R pin on the PLL is pulled low which selects a VCO division in the range of 5393 (Ch 1) to 5481 (Ch 40). The VCO generates a frequency in TX mode from 13.4825 Mhz (Ch 1) to 13.7025 Mhz (Ch 40). The 13 Mhz VCO is then doubled to give a TX output in the 27 Mhz range. In TX mode a capacitor is placed in the VCO circuit to lower the VCO frequency from 16 Mhz RX mode to 13 Mhz TX mode.

Because the PLL accepts the direct VCO input (13 - 16 Mhz) and the channel selection is decoded by ROM in the PLL, this radio is not easily modifiable and changing the 10.240 Mhz crystal is NOT the way to go!

I didn't get your original message so I don't have your email address, so maybe someone that does have your original message will forward this message on to you.

Regards,

Phil

Kbballard:

I went to deja.com and did a search of the alt.radio.family newsgroup. It indicates that you have posted here 123 times since 8/99. Out of those 123 messages that you have posted here, in a large percentage of them you have harassed, ridiculed, and/or blasted anyone else who have said even the slightest negative thing about Motorola radios. Anyone can see this from reading the newsgroup's archives on deja.com. You obviously can't stand the thought that your precious Motorolas might not be as "golden" as you make them out to be, can you?

I like Motorola's products also, but Kbballard, give it a break!

IN HEAVEN

A petty thief, a teacher and a lawyer die and go to heaven.

When they get there they are stopped by St. Peter, who then says,
"Sorry, heaven's crowding up, so you need to answer a question
correctly, or else you can't get in."

He looks at the teacher, and asks her: "What was the name of the
famous ocean-liner that sank after hitting an iceberg?"
"Oh, that's easy," the teacher replied, "the Titanic." So St. Peter
let her into heaven.

Next he turned to the petty thief. "How many people died on that
ship?" St. Peter asked. "Oooh, that's tough, but I saw the movie, and
it was 1,500." St. Peter stepped away and the thief walked into
heaven.

Finally, St. Peter turned to the lawyer.
He simply said to him: "Name them."

FASTEST THING IN THE WORLD

There were 4 guys sitting in a bar. One of them decided to play a little game about what each of them thought was the fastest thing in the world.

Well the first guy says, "I think a Concord Jet is the fastest thing in the world, because it can go faster than the speed of sound."

Well the second guy says, "Well I think I got you beat on that one! I think lightning is the fastest thing in the world, because it can go faster than the speed of light and sound."

Well the third guy says, "Well I believe i have both of you beat. The brain is the fastest thing in the world, because whenever you need something, it is right there for you."

Well the fourth guys clearly states, "Well I have got you all beat! I think the anal sphincter muscle is the fastest thing in the world."

The other three guys say really? Why's that?

And the fourth guys says, "Well I was on a Concord Jet, it got struck by lightning, and I didn't know what to do ... so I shit my pants!"

Using an amp on CB is like peeing in a public pool,

NEVER LEND MONEY

A husband leaves the house to go pick up dinner for he and his wife.
Shortly after leaving, the doorbell rings.

It is her husbands best friend and she invites him in. Since she is in
her bathrobe the man says to her "you have the nicest breasts". She
says "thanks but my husband would be mad if he heard you".

He replies "I would pay you $10 just to see one of them". She thinks
for a minute and decides to do it.

He says "Wow that is the most perfect breast I ever saw....I will give
you another $10 if you show me both at the same time".

She does it, and he gives her the money. The friend leaves and her
husband comes home. She says "your best friend just stopped by". He
answers "Great did he leave the $20 he owed me"

THREE WISHES

A huge muscular man walks into a bar and orders a beer. The bartender hands him the beer and says, "You know, I'm not gay but I want to compliment you on your physique, it really is phenomenal! I have a question though, why is your head so small?"

The big guy nods slowly. He's obviously fielded this question many times.

"One day," he begins, "I was hunting when I got lost in the woods. I heard someone crying for help and finally realized that it was coming from a frog sitting next to a stream."

So I picked up the frog and it said, "Kiss me. Kiss me and I will turn into a genie and grant you 3 wishes."

So I looked around to make sure I was alone and gave the frog a kiss. POOF! The frog turned into a beautiful, voluptuous, naked woman.

She said, "You now have 3 wishes."

I looked down at my scrawny 115 pound body and said, "I want a body like Arnold Schwarzenneger."

She nodded, whispered a spell, and POOF! there I was, so huge that I ripped out of my clothes and was standing there naked!

She then asked, "What will be your second wish?"

I looked hungrily at her beautiful body and replied, "I want to make sensuous love with you here by this stream." She nodded, laid down, and beckoned to me. "We then made love for hours!"

Later, as we lay there next to each other, sweating from our glorious lovemaking, she whispered into my ear, "You know, you do have one more wish. What will it be?"

I looked at her and replied, "How about a little head?"

There is a lot of FRS activity around where I live, but for the most part
the communications are polite and purposeful.

Lets not beat on FRS too much here. You are a Ham radio operator... Surely
you are aware of certain Amateur frequencies that you can hear CB-like
operation any time of the day? And this is not short range like FRS - you
can hear this crap going on from 1000+ miles away!

Regards,

Phil
(KA8FJA)

Nope, they will stay on CB channel 19. Truckers won't like FM without the
"swing" and 11 meter CB is too well established.

Subject: Measuring Standing Waves on a Transmission Line with a DC Voltmeter?
Newsgroups: sci.electronics.design
View: Complete Thread (6 articles) | Original Format
Date: 2002-06-04 09:57:01 PST

I am having a disagreement with someone over his claim that you can measure the standing wave ratio (SWR) on a transmission line with a DC voltmeter.

This is the method he has outlined:

"Locate the point across the twinlead with either the greatest or least DC potential. Measure it. Move the probes one-quarter wave up or down the transmission line. Measure it. Do the math."

He explains:

"SWR is the ratio of Vmax to Vmin on the standing wave. The wave doesn't move (standing?) and can be measured as a DC potential. It's easier to measure on twin-lead since you don't have to poke through the shield, but you can indeed measure SWR with a
DC voltmeter." snipped"

My my, you are a grumpy old fart!

Many college's engineering curriculums *require* you take engineering ethics, so I doubt that he had any choice if he wants to get his degree.

Obviously you didn't stop to consider this possibility did you?

There's a subtle difference between what British Cb'ers post on here
and the blatant trolling Mr Voobner carries out on uk.rec.radio.cb

>
> >From the ammount of time he appears to spend on this Ng, it is
> >patently obvious he is unemployable, resides in a trailer park and

> From the amount of whining you keyclowns do about Voobner>

Au contraire, my friend, personally I run a strictly legal station in
the UK, and I would gladly welcome any inspection from a UK radio
official.

> No, not really. If someone is going to stand up for what they think is
> right, the expected response from the opposition is to discredit him
> in any manner possible.

Standing up for what you think is one thing, hijacking a newsgroup and
using it for a personal crusade is another. Quite frankly his vendetta
has become somewhat monotonous. Clearly Mr Voobner he has made his
point, perhaps someone should tell this, as right now he seems to be
marching to the sound of his own bugle?

Best Wishes
tox

Who wants whom to win the fight tonight? My vote is for Lewis, although I don't have a lot of faith he will pull it off.

> > If they use any illegal
> > equipment who are they harming?
>
> Not true, and you know that. This case is clear cut. There are still many businesses users on those channels, and there is nothing in the rules that says they have to leave either! So the idiots running the high power on the MURS license free channels are in fact interfering with the current legitimate users of those channels. The power is deliberately kept at the 2 watt level, or less in many cases, to limit any interference to other users on the same channel.
>
> For example there are two fast food outlets, and a "Laser Quest" Laser tag game hall, all within a couple of miles of my apartment. All use the same MURS channel frequency. None of them have a problem because the TX power is kept very low. You get more than a quarter mile away and you can't even hear them any more. Now if you get some idiot running 50 watts, by using a modified Ham 2m rig illegally on MURS, which could easily cover a 20 to 30 mile radius all round, the interference problem becomes huge.
>
> > Nobody.
>
> Talk about being out of touch with reality. I'll bet you didn't even think about the problem.
>
> --
> Leland C. Scott
> KC8LDO

I am not out of touch. My brother drives an 18 wheeler and
long range communications is needed for open road
talk -- and MURS sounds like the right thing. FCC can't
enforce it anyway.

Amateur Radio Newsline™ Report 1295 - June 7 2002

==========

A NOTE TO THOSE WHO ONLY “READ” AMATEUR RADIO NEWSLINE(tm)

For those of you who only know of the Amateur Radio Newsline (tm) as a text newsletter we would like to invite you to listen to the audio version. This Amateur Radio Newsline (tm) script is actually written for the “spoken word.” It is recorded each by professional broadcasters and is available for private listening or rebroadcast over your repeater. Two methods of delivery are available: FTP MP3 or dial-in telephone.

Please visit our website at http://www.arnewsline.org for a list of telephone numbers (you have to pay your own long distance charges) and links to audio servers providing our voice newscast. Free FTP Downloads are available at our site by clicking on the newscast number at the top of the page.

The Newsline Production Team

==========

Amateur Radio Newsline report number 1295 with a release date of Friday, June 7th 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. Kids Day is coming and a legend leaves Top Band. These stories are first on Amateur Radio Newsline report number 1295 coming your way right now.

(Billboard Cart Here)

**

ON THE AIR: KIDS DAY COMING JUNE 15TH

It’s possibly one of the two mot important ham radio days of the year, and its only a week away. We are talking about the second of two Kids Day operating events held every year. Amateur Radio Newsline’s Bruce Tennant, K6PZW, has the story of the event and the man who made it happen:

--

The next Kids Day is June 15 from 1800 to 2400 UTC. Thats Saturday here in the United States. Most of the activity is on 20, 15 and 10 meters, but you can also put kids on the air on your local repeater if you wish.

Kids Day is not a contest. In fact, it is a non structured event where all you have to do is to call C-Q Kids Day, and then put the youngsters visiting you on

the air to talk with other kids visiting other hams. Once the children are talking,the suggested contact exchange might include the youngsters names, their ages, their location and -- for the younger ones -- favorite color. Best of all you can work the same station over and over again if the operator continues to change.

If this all sounds like a great way to spend a day, you might be interested in learning ewhere Kids Day came from. In reality is the story of vision by one man. A man who long before most relized a problem even existed.

It was Larry “Tree” Tyree, N6TR, who recognized that ham radio had no future without a steady influx of new, young hams. Kid hams filled with the wonderment of childhood. That thirst we are all born with to “learn.” To “experiment.” To find out how this or that “really works.”

But Tree Tyree did not just sit there and say let somebody do something. Working woith Oregon’s Boaring Amateur Radio Club, he went out and did it himself. And in creating Kids Day, N-6-T-R, probably established the most important “ham radio holiday” that we have.

“Kids Day.” Just think what it really means. It two days every year where we “grown-up” hams open our hearts, minds and stations to the young. We invite them in. We put them before a mic or key. We put them on the air to experience first hand the “magic” of radio. Then we silently pray they some of them will knock on the door again and say: “...can we talk on the radio again?” When that happens, we know that ham radio’s survival is insured for yet another generation.

For the Amateur Radio Newsline, I’m Bruce Tennant, K6PZW, in Los Angeles.

--

The first Kid's Day event was held on December 2, 1994 but it was, N6TR, who took “Kids Day” from a dream to a twice yearly reality now sponsored by the A-R-R-L. And in doing so Larry “Tree” Tyree N6TR figuratively “paid the premium” on the life insurance policy that is Amateur Radio. (ARRL, ARNewsline™, W6AQ)

**

RESCUE RADIO: NEW MEXICO WILDFIRE EMERGENCY FOLLOW-UP

More this week on the role that Amateur Radio operators in New Mexico played as a wildfires raged in that state. As reported last week, hams were called out as soon as the fire emergency was declared. Now, the ARRL Letter provides some in depth follow-up.

The Letter says that on May 23rd, an incident command post was set up in the town of Espanola in response to a so-called "sleeper fire.” This is a lightning-caused fire that smolders before bursting into flame.

This one erupted near the village of Truchas in north-central New Mexico. Over the Memorial Day weekend, more than 250 residents were evacuated from their homes in Truchas and the nearby village of Cordoba.

Rio Arriba County Emergency Communications Manager Lonie Scott, AH2AZ, activated amateur communications support. Amateurs were dispatched to Red Cross shelters set up at two elementary schools in Chimayo, and The Los Alamos Amateur Radio Club's W5PDO system provided support.

By late on May 24, the wind had shifted. The fire was burning away from Truchas. Residents were able to return home starting at 9 AM the next day. New Mexico Section Emergency Coordinator Bill Kauffman, W5YEJ said the incident command post and the shelters closed later that day after all evacuees had returned home.

As of May 29th the fire was still burning in the Pecos Wilderness area of the Santa Fe National Forest, but was not considered a threat to any homes or structures. But as tinder-dry conditions persist across the South-West, amateurs remain on alert in case more wildfires break out. (ARRL)

**

ENFORCEMENT: PIRATE BROADCASTER BUSTED IN PUERTO RICO

Turning to the regulatory arena, the Federal Communications Commission has announced that an investigation by the it’s Enforcement Bureau has led to the seizure of unlicensed broadcast radio equipment allegedly operated by Amil Lugo-González.

The station had been operating on 99.5 MHz from Jayuya, Puerto Rico. The FCC San Juan Office, working in conjunction with the United States Marshals Service and the Office of the United States Attorney for the District of Puerto Rico, seized the equipment on May 21st. The FCC says that on more than one occasion it had issued notices to Lugo-González directing him to cease operation of the unlicensed station. (FCC)

**

ENFORCEMENT: SHORT TERM RENEWALS GRANTED

Meanwhile, two radio amateurs have been given short term renewals of their Amateur Radio licenses. The FCC’s Riley Hollingsworth tells us who they are and the reason each is getting a shortened license term:

--
Hollingsworth: : “A short term of an upgrade to Extra class was given by the Wireless Bureau to Sam Jacobs, K3SAM. The grant was short term due to previous problems involving the filing of a club call sign application.

And, a short term renewal was given to Peter Figuroa, N6IWH, of Berkeley California. Figuroa had been on the Amateur Bands after theexpiration of his license but there were some extenuating circumstances.”

--

In both instances, two year license renewals were granted. If there are no other enforcement issues with either Jacobs or Figuroa over the next two years, each can apply for a full 10 year license renewal in 2004. (FCC, RAIN)

**

Break 1

From the United States of America, We are the Amateur Radio Newsline, heard on bulletin stations around the world including the AF4CY repeater serving Madison Virginia.

(5 sec pause here)

**

CHANGING OF THE GUARD: THE 160 METER GATEWAY NET GOES QRT

A longtime fixture on Top Band has gone silent. This as Vern Jackson, WA0RCR, announces that he has terminated operation of his famed 160 meter Gateway Net. Here is the announcement as Jackson himself made it:

--
AUDIO ONLY REPORT: HEAR IT AT WWW.ARNEWSLINE.ORG
--

Over the almost quarter of a century that it existed, Jackson's net presented some of the top news and information sources in ham radio. This includes Hap Holly's Radio Amateur Information Network and Amateur Radio Newsline, all in high fidelity A-M. (WA0RCR)

**

THE VEC SYSTEM: NEW TECHNICIAN SYLLABUS RELEASED

The Question Pool Committee of the National Conference of Volunteer Examination Coordinators has released the revised Technician Class Element 2 Syllabus into the public domain. This syllabus will be used to develop the new question pool for Technician Examinations going into service on July 1st, 2003. All amateurs are encouraged to submit candidate questions to the Question Pool Committee by this coming September 15th.

Now before you sit down to dream up new questions there are some strict guidelines that must be followed. All proposed questions must be no more than 210 characters in length. This includes all spaces and punctuation. All answers and distracters no more than 140 characters including spaces and punctuation and you must identify both the syllabus area and the correct answer. Also, if the question is rule based, identify the exact reference in the Part 97 Amateur Service rules.

Candidate questions should be sent via e-mail to QPC@arrl.org. The complete syllabus will be posted to the ARRL website within the next few days. (W4WW, NCVEC)

**

REGULATORY: JOINT U.S.- MEXICO COMMISSION MEETING CONCLUDED

Call it radio regulation on an international level. This with an announcement that the FCC's Enforcement Bureau recently took part in the 26th formal meeting of a regulatory body known as the Joint United States and Mexican Commission.

The Joint Commission, formerly known as the Mixed Commission is made up of representatives from the United States and Mexico.
The latest meeting took place in Mexico City during the week of April 22nd. During the gathering the group reviewed 115 cases of harmful radio interference in the United States and Mexican border zone. Of these, 47 were officially closed. A report is at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-02-1063A1.doc (CGC Communicator)

**

REGULATORY NEWS: FDA WEB AGE ON RADIO FREQUENCY HAZARD FROM CELL PHONES

The Food and Drug Administration and the Federal Communications Commission have established a joint web page called "Cell Phone Facts." This, in an effort to provide reasoned answers to the public's never ending health and safety questions concerning the radio frequency power produced by portable cellular and PCS phones, and their base stations. The site is in cyberspace at www.fda.gov/cellphones (FDA, FCC)

**

CONFERENCES: ARRL/TAPR DIGITAL COMMUNICATIONS CONFERENCE

Technical papers are solicited for presentation at the 21st Annual ARRL and TAPR Digital Communications Conference. The event will be held September 13th to the 15th in Denver, Colorado.

The annual conference proceedings are published by the ARRL. Presentation at the conference is not required for publication. Submission of papers is due by August 5th. Conference registration details and updates, along with more information are in cyberspace available at www.tapr.org/dcc (TAPR, ARRL, ANS)

**

HONORS: CQ MAGAZINE ADDS TO HALLS OF FAME

Forty-four new members have been added to the CQ Amateur Radio Hall of Fame, while the CQ Contest Hall of Fame and the CQ DX Hall of Fame each grew by one member. This, with OZ1LO being honored by his fellow contesters and W0AR being recognized for his accomplishments in DX’ing. The announcements were made at the recent Dayton Hamvention. A complete list of winners is in cyberspace at www.cq-amateur-radio.com in the “announcements” area. (CQ)

**

BREAK 2

This is ham radio news for today’s radio amateur. From the United States of America, We are the Amateur Radio Newsline with links to the world from our only official website at www.arnewsline.org.

**

EMERGING TECHNOLOGY: THE NEW E-MAC

Apple Computer has unveiled a new line of computers exclusively for educators and students. Apple says the new e-Mac will feature 17-inch monitors and high speed G4 processors. The e Mac is slightly smaller than the iMac and includes stereo speakers and a CD-recordable drive. The price for the new e-Mac machines will begin at 999 dollars. (Appple press release)

**

HAM RADIO IN SPACE: BOY BAND MEMBER MAY NOT MAKE IT TO SPACE

Possible problems for a boy-band member who wants to fly in space. The latest news reports quote the Russian Space Agency as saying it has no contract in hand to carry 'N Sync's Lance Bass to the International Space Station.

As previously reported here on Amateur Radio Newsline, Bass has made public his wish to visit the I-S-S. He has already made a trip to Russia to undergo medical tests in preparation for a seat on an upcoming flight.

As of airtime, its not known if Bass has been approached regarding his getting an Amateur Radio license and taking to the ham radio airwaves if he does get to make the trip. (Published reports)

**

INTERNATIONAL – CANADA: NEW RAC CANADA DAY CONTEST MANAGER

Radio Amateurs of Canada Contest Manager Joe Mac Pherson, VE1CH, has announced that the Moncton Seniors Amateur Radio Club has taken over responsibility for the management of the R-A-C Canada Day contest. This, effective immediately. Mac Pherson says that all inquiries or electronic logs related to the R-A-C Canada Day Contest should be directed to ve9qed@rac.ca. Non-electronic logs, for the RAC Canada Day contest should be mailed to the Moncton Seniors Amateur Radio Club at Post Office Box 73, Moncton, New Brunswick, Canada. The postal code is E1C 8R9.

**

INTERNATIONAL - GIBRALTER: RESTRUCTURING AND A NRE LICENSE CLASS

License restructuring is coming to Gibralter. Peter Naish, VK2BPN in Australia has been advised by Wilfred Guerrero that Gibraltar will be introducing the New Foundation Licence by mid-June. Guerrero, who is the Secretary of Gibralter Amateur Radio Society says that the new llicense will be similar to the highly successful Foundation License recently put in place in the United Kingdom. The prefix to be used will be ZB3. (Q-News)

**

DX

The 6 meter D-X season seems to be here. Jay Kesterson, K0GU in Colorado reports over the VHF Reflector on some very early season E skip openings to Europe. Jay notes that on June 4th at 15:14 UTC he heard the EN19 beacon. He then checked for European video signals and was surprised to hear many of them on and near 49.750 MHz. Jay says that some were S 9 plus 20 d-b. He then worked SM3UZS at 15:50 U-T-C followed by OH7PI at 16:45. (VHF Reflector)

Still with 6 meter D-X news, word that St. Paul Island should be on the air late June 29th through July 9th. According to Herb Spoonts, W3IWU, the operation will feature a full time, dedicated six meter station operated by W7XU, N0QJM, W0SD and W0OE. Herb says that the six meter station will only transmit on 50.157 MHz listening up 5 kHz and more when needed. Liaison will be on 28.885 MHz and updates will be provided to the appropriate Six Meter Internet sites and reflectors. St. Paul Island holds the prefix CY and is located in Grid Square will be FN97. QSL via W7XU. (Via E-Mail)

On the High Frequency bands, GB2RS reports that JH0IEW/JD1 and JE0EHE/JD1 will be active from Ogasawara Island through the 16th of June. They will be operating on 80 through six meters, including the WARC bands on SSB and CW. QSL to home calls or via the bureau. (GB2RS)

Also, keep an ear open for W5AA slash TI8 from Costa Rica until the 17th of June. He will operate on all bands with an emphasis on 30, 12 and 17 meters. QSL as directed on the air. (GB2RS)

**

THAT FINAL ITEM: ATOMIC COFFEE MAKER

And finally this week, if you are a ham who has trouble waking up to keep those wee hours D-X schedules, the answer may be as close as the local appliance store. How about an atomic time coffee maker?

No, we aren’t kidding. We discovered this one last week in an appliance store in the Ft. Lauderdale Florida area. It’s called the Perfect Time Coffeemaker, and according to its manufacturer Melitta Salton Inc, it’s the first such device using radio frequency reception of atomic clock signals to keep it in sync with the National Bureau of Standards time keeping system.

Melitta Salton claims that the internal clock provides accurate time right out of the box by monitoring the WWVB broadcasts from Boulder Colorado. All the user need do is to select his or her time zone and the coffeemaker does the rest. It even automatically adjusts to Daylight Savings Time and its internal back-up batteries keep it going during short duration power losses. Salton also says that it also brews good coffee. And what more could any D-X hound ever ask for. (ARNewsline/4)

It's not the right thing if you want long range communication
regardless of power. 11 meters will do better.

Oh, jeez....I hope Tyson gets the snot beat out of him. He has shown his arse one too many times for me to respect him. I was glad when Holyfield beat him the last two times (regardless of how Tyson lost, whether it was the ear biting fiasco, or TKO, or whatever, it was a loss nonetheless, hehe). I hope Mr. Lewis wins this time. Mental problems or not, I'm not very impressed with Mike Tyson's antics in the past, and he most certainly deserves to lose (ooh, I am judging someone, lol). If Tyson wins, so be it. If not, hehe!

I am a retired trucker and have run many miles on secondary highways in Okla, Ark and Missouri and believe me dependable short range communications (3-5 miles) would be a great asset to any driver. I know that shooting 11 meter would be more fun but feel that a good narrow band FM (not sure about 2 watts) would provide a better safety factor. If you ever had to weave an 18 wheeler at 70+ through a heard of black angus you would see my point.

Rob Mills

PS, My experience is that 99% of a truckers radio gab is done at eyeball to eyeball range and it fades real quick once the other truck is behind your trailer.

I'm not sure either?! It just sounded good! :o) But, none the less, if
I were given a choice for a transceiver revival, well, the DAK Mark X
SSB w/the beautiful Golden Eagle mic, I'd be a happier fellow.

PS- Sorry for the mistype!!! It should be DAK, not MAK.

Hello Mr. Mills,

Is this the one with the analog clock/timer built unto it?

>Is this the one with the analog clock/timer built unto it?

No clock. I did just open it up and it is very clean inside and I couldn't believe the size of the power transformer, looks more like it came out of a large audio amp. I did notice that the push button tone switch has been disconnected and it now switches a pair of added crystals which tells me it is modified to go up or down.
It's in a wood cabinet and is about 18 inches wide by 6 inches high and about 12 inches deep (a big un). It has 3 meters, swr, xmit power and modulation. I purchased it at a church garage sale this afternoon (wouldn't have messed with it if it hadn't been so clean) and the nice lady holding the sale tried to give me the "turn table that went with it", I declined. :-)

RM~
PS, It is a 23 channel, probably one of the last 23's

Ok, Thanks!

I wasn't sure if it was one of the transceiver with clock or not (as i operated one with the clock/timer built-in years ago (I don't even remember the model # <g>)). I'm not even sure if it was one of the last Series of Royce with clock or without clock?! Oh, well!

Who died and left you in charge? Are you an amateur operator,
if so, leave us alone please.

MURS will open opportunities for everyone:

1) Scanner operators: They will listen as usual; it's what they do...

2) HAMS: they will modify their radios and use MURS, too - to
speak with non licensed friends and associates.

3) Truckers and CBer's: An opportunity for better communications
without interference from skip and trashy people.

4) I will set up a 3 db gain antenna on my building (on a hill)
and talk with everyone in my town. I can hardly wait!

Guanajuato why not mind your own business?

>
>73 de Egbert
>WA2SI

Bert, where did I ever say it was illegal to talk about illegal
operation? I didn't. I said it was not appropriate for -this-
newsgroup, a newsgroup for CB radio. And the FCC's definition of the
Citizen's Band radio service is THE definition of CB radio -- the FCC
is the defining authority.

But here's something else to think about: if someone is going to
ignore the FCC's authority as they please then there is no reason to
believe they won't ignore any other service defined by the FCC,
including amateur radio, whenever it suits them to do so.

I hope you can figure the rest out for yourself.

Actually the ARNewsline is almost always 100% off topic
(occasionally only 90% off topic). Meanwhile the flamewars are a
total waste of bandwidth -- which makes them exactly the same as 90%
of CB radio on-the-air operations.

More like trying to put an end to an extremely assinine argument. They're both correct from two fifferent standpoints, so the argument's kinda moot.

BTW, it IS legal "to be able to TALK about illegal CB." You're also shooting down Frank's argument. There's no such thing as illegal CB. Once you violate Part 95, you're outside of the FCC's definition of CB...hence, you're no longer CBing. 'Twas a nice try though.

The FCC may not enforce it, but I'd imagine the possibility exsists to
have a few questions asked upon truck inspection.

You are reading the input "match" of the amplifier... not the antenna. You need to adjust your antenna to the best match you can with the amp OFF. Then, whatever match you get with the amp on is a result of the amplifier input circuitry. Unfortunately, most amps have a lousy match... should have bought a SkyWave, you wouldn't have that problem.

I've decided to be rational for once and rethink my stance on MURS. It really is a great band and a lot of fun for the ones who don't care about passing a test or trying to impress people with neat call signs and lots of little uhf antennas on there vans or lots of ht's on there belt. At first I was a bit bothered by the fact that most of the people on the band seemed much "cooler" than myself and nobody really wanted to talk to me even after I told them I was a ham and running a yaesu radio! From now on I will just ignore this band full of the same type people that used to beat me up in school and I'll continue to talk to my friends on rec.radio.cb via the Internet and kerchunking the machines on 2 meters.

Yeah Prof, that about sums it up. Sorry I had to search to find the
thread.
You telling me that never happened to you???? Now be honest! The other
day a buddy calls. He's got 2 older computers,a 90 mhz Pentium and an
old
486DX2 50. Well the 486 was toast, we scrounged the vid board, modem
and
other parts. The 90 tower worked but had errors on bootup. So we
tweeked and
tuned and she was working great. The cpu fan was out so we installed
the
one the 486 had (unknown why somebody put a fan on a 486) and fired
her back up.
I guess during the switch over a static charge must have transfered to
the CPU cause she wouldn't respond. We tried evertything. DOA. That's
the way it goes sometimes. We got a 2 gig hard drive and a ton of RAM
outta the mess!
PS The "If it aint broke, don't fix it" is a footer, as if you didn't
already know!
Later Prof.............

>bert you know as well as i do there cb amps...

I know that there are amps that are designed and manufactured specifically for use with CB radios and on the CB.

Q: Are they illegal?
A: Absolutely!

Q: Do they exist?
A: Absolutely!

Are they open topics for discussion? This is America, of course they are. Both of you are playing a silly little game of semantics. Tim, Spark's got a point from an altuistic/technical standpoint. You also have a point re. their relevance to CB.

I've been in countries where there were topics that REALLY weren't open for discussion...under FORCE of law. Once you've seen that "up-close and personal," you tend to appreciate the ability to simply change the channel. (or newsgroup thread)

Len, it is a normal thing that happens with el crapo amps. Whenever a signal is distorted you generate multiples of the operating freq. Your antenna throws up and sends them back to the amp which mixes them some more and sends them to the antenna which promptly sends them back and the beat goes on.

I would recommend the services of an undertaker and give the amp a decent burial but failing that find what is called a 'low-pass' filter tuned to 30 MHz or so with an adequate power rating and put in in the line right after the amp. As well as get your SWR back, it will also knock down the TVI pretty well. You will note that your output power will drop which is a really good measure of how much crap it is spewing.

Unfortunately, it will not get the inband crud you will spew at the same time but 27 MHz always was a garbage dump.

Dick NBK

> have anyone midland 79 893?I have one question:This radio have FETs in
> the receiver section?What is the sensibility on am/ssb?
===

There were a few UK radios with FET front ends, they were no
better than any other cheap CB.
They suffered with "bleedover" (mainly gain compression), so if they
did have a higher sensitivity, it was outweighed by the bleedover problem.

Most CB radios are about the same for sensitivity, it is extremely hard to
gain in that area without getting problems of "swamping" from strong signals.
What you have to look at is the dynamic range, and you will find that the way
to improve this is to look at whether the radio can withstand a strong
signal... this is where the poor radios fail.

I have worked on CBs and expensive PMR equipment, checking the
sensitivity. CBs often came out on top for pure sensitivity, but once
you introduced a second signal, gain compression and cross
modulation became the problem.

Regards,

Brainbuster.

====

Hey, we agree on something!!
As for Aaron, no, I was not referring to Aaron but the original post in this thread (ka2tus@aol.com - Ka2tus), who complained about people actually charging money for their time and effort.

The "don't want to pay for it" attitude caused the UK to be flooded with cheap equipment. There was one UK board (used in several radios) that ripped through the band (and neighbouring bands) every time they were keyed up. Anyone nearby could hear a "farting" through the band every time the owner keyed up.
And that radio was legal, fully approved by our government.

===

Rather different from Aarons forged version, even the subject was
totally different.

Looks like Aagent Aaron is still on that "crusade", with no proof (apart
from his standard reply of "sod off" when he realises his mistakes) and
using forged posts.

Poor Aagent Aaron, still listening to those voices that tell him that I
am flitting around the UK using Internet cafes all day.

Well, seems like I had a busy day Saturday... I bet you all wish
you had a car that could do that many miles in such a short time,
with time to spare for driving through and parking up in the cities.
Hey, become an "M&S Vannie", and you could have such a car
and be able to support such a lifestyle.

Maybe Aagent Aaron works in a bar, serving drinks for a minimal
wage... because he sure acts like a sad bar steward.

Brainbuster.

>
> Hey Brainbuster, I was wondering a while back, what modes and frequencies
> are allowed in the UK and other EU contries? I know much is different
> across the pond.
===

Hi Randy.

FREQUENCIES:
26.965 - 27.405 MHz (also in EU)
27.60125 - 27.99125 MHz (UK only)
Dual band radios are now allowed.

MODE:
Frequency modulation only.
SSB is being looked at with the suggestion that we may get it.

ANTENNAS:
Omni-directional only
Half wave max. dipole
5/8 wave max other antennas
55mm max width.

POWER:
4 Watts maximum.

DISTANCE:
No legal limit.

Linears are NOT illegal to own or sell, although non approved CB radios (such
as US models) are. With an Amp, they have to prove you have used it on CB,
but for an illegal radio ownership could be enough.
Strangely, the RIS do not look in the "free-ads" papers for offenders,
although the police sit on street corners looking for people to pull over. I
guess that may suggest where the law enforcement priorities are.

Regards,

Brainbuster.

Sorry to burst your bubble Aagent Aaron, but theres a couple of
rather large HOLES in your "running" theory...
I have gone nowhere, I am still on this group.
I have been on the UK group as long as this one.

And your "crying" theory... open your eyes, Aagent Aaron, you will
see the complaints from other UK group regulars. They don't want
your c**p on there either.

Oh, and there's a hole in the "stirring" theory...
I am just responding to your hate posts, you are the one stirring.
You have been "stirring" for several years, I would have a
long way to go before I catch up with you.

Once again, you are showing that your priority is trolling the newsgroup.

Brainbuster.

Once again, you prove that the word "Keyclown" is simply a label
for anyone who disagrees with the methods of the "AKC" group.

===
> Your demeaning speculation of his lifestyle,
> right or wrong, is only verification that his actions are being
> effective. Very good really :-)
===

So, you measure his "effectiveness" by how many people he can
upset, with *legal* CBers and radio amateurs being "fair game"
and so counting towards the final figure.

Brainbuster.

You'll have a lot of fun with it.

I'm using an 8' VHF marine antenna about 25 feet in the air (not on a
hill) and can talk all over my city (base to mobile) and into many
surrounding cities. I'm using a few Radio Shack VHF mobiles set to 2
watts.

MURS (Multi-Use Radio Service) is a no-license VHF personal radio service which operates on 151.820, 151.880, 151.940, 154.570, and 154.600 MHz. The FCC MURS rules permit voice and data communication; as well as external gain antennas. There are no restrictions on business activities with MURS, and the 2W transmitter power limit works as a major benefit in reducing interference, and allowing more users per channel. External power amplifiers on MURS are of little or no benefit, so most of the problems present on the 11m CB radio "zoo" do not exist on MURS. Most any low-power VHF Part 90 business radio can be used on at least some of the MURS frequencies. Additionally, the new rules no longer specify an ERP (Effective Radiated Power) restriction - so it is now possible to build quite efficient mobile and base stations, using external gain antennas.

For more info:
http://groups.yahoo.com/group/MURS-OPEN

Hello Joe:

Yeah is that the radio that had the 4 meters, 2 on the left and 2 on the
right? Or all 4 meters across the front panel???

That was Bitchen looking radio. If I had one I would make a matching
Linear Amplifier to go with it.

I picked up a Tram D201A few months ago, and asked the group about a
Matching D201A Linear Amplifier, but it appears none where made.

Just picked up a small 1 tube amp at a yard sale, it has a single 1625
Tube, and is made from a old Johnson Radio Chassie, it looks great! It
has a date stamped on the back as 1964??!?!

>operation? I didn't.

Agreed. I was responding to the anonymous screen name's comment.

>I said it was not appropriate for -this-
>newsgroup, a newsgroup for CB radio.

Understood, Frank, but you (or I) don't get to make that call alone. Who controls USENET, Frank? Have you tried running it past them? Perhaps you can get them to moderate the newsgroup? But then that also opens up another issue. It's THEIR job to moderate the newsgroup, not ours.

>And the FCC's definition of the
>Citizen's Band radio service is THE definition of CB radio -- the FCC
>is the defining authority.

Agreed, but that's on the air; NOT re. discussion thereof on a recreational USENET newsgroup. As long as you don't attempt to use the NG to sell amps, you can certainly talk about them.

>But here's something else to think about: if someone is going to
>ignore the FCC's authority as they please then there is no reason to
>believe they won't ignore any other service defined by the FCC,
>including amateur radio, whenever it suits them to do so.

Agreed, but what does that have to do with this issue?

>I hope you can figure the rest out for yourself.

I can and I have...,with more than a few years of practical experience thrown in for good measure.

Have you fired the beast up?? You more than likely have the world's first
and greatest 25 watt line-ee-ar. A 1625 is a 12-volt 807 which in turn is
a 6L6 with a top cap. If you need to replace it steal a 12L6 out of a
vintage car radio.

Protecting one's turf from interlopers does not mean someone
hates another. Dick, in protecting his spectrum from intruders,
is not doing anything different then you would be doing by
putting up a fence to keep the kids out of your back yard.

Gee, Sparks, I used to think you were sane. CB has no harmonic relationship with any ham band. If you figure out why I do much of anything that won't get me paid, laid, or fed please tell me cause I sure as hell don't know for sure. As far as 27 being a dump, it has been since they made tank radios run there with FM and superregens. How much crap is still on Channel 23, 27.255? There is still an alarm system running in a K-Mart on 27.255 somewhere. Hell, TV i.f.s used to be there.

That the present residents seem hell-bent to turn the dump into an Illinois-class slum is just icing on the cake. I have made it more or less a mission to at least present some opposition to the lore and mythology rampant up here; the difference is that I know damned well I will never get it done.

You are sounding more and more like a frustrated ChannelMaster.

Scott, a 30 MHz LPF does exactly zilch for the ham bands so as a
'protector' it is an effort worthy of Sir Rodney.

It does, however, allow me to pontificate, as only an OT Extra can, on
such things as harmonics, distortion, and amp power levels inflated with
spurious crap thrown in for meter-reading purposes. It is perfectly
consistent with the kind of thing that I have used to bore people stiff on
this group for some months now. Sparky apparently got the suppository in
sideways somewhere along the line.

In retrospect, I think the poster who suggested our Nimrod was looking at
the internal meter in the exciter facing the input tank of the mighty
Belchfire amp probably had it right.

With all that carrier and so little audio from the Class C amps, find yourself some good old AM rig and mod the finals to push-push operation leaving only Double Sideband supressed carrier output. Zero beat the herd and their carriers will make you the loudest thing in the band.

There is no payoff in being the only sane man in the asylum; sometimes you just have to be insane a little smarter.

Hello Dick:

Yes I am aware that the 1625 is a 12 volt filament 807, but I didn't know it was a 6L6 or 12L6 type tube with a Plat Cap, ya learnin something everyday on the ng if your ah readin the mail ah!

I am sure the 25 watt output was cause for major concern back in its day, and only the Biggest Straps would use such a thing back then, when the receivers were not all that sensitive, as in a garden variety of all the equipment. And antennas couldn't take such amounts of heat, let along the old days RG-58 coax.

No the amp is not for use, but as a collects piece, I have a few of these older, vintage 1959 to 1966 type Linear Amplifiers, which where the years just before Japanese Manufacturing was so popular.

I may fire it up to see if it works, more than likely the filter caps are shoot, but in some amps these used W.W.II surplus oil caps.

There was a Linear Amplifier that was manufactured by a Ham Equipment manufacture back in the 1960 era, that used a single 4X150 Glass/Metal Tube, in a after market type or self manufactured, tube socket and chimney. This amp was made for low power output transmitters in the times, and boasted a 100 watt output, not bad in 1960 ah?.

For the life of me I can't seem to remember the manufacture, but I know where one is located. And I am working to buy it.

25 watts,..... Woooo hoooo!!!!

1130. Uniden HR 2600 Amateur Radio

Newsgroup: rec.radio.cb
Date: 2002-06-10 00:14:36 UTC
From: Mark <grandmhg@gocougs.wsu.edu>
Message-ID: <ug7rt0snn2c059@corp.supernews.com>
Source record: 127034

Uniden HR 2600 Amateur Radio. It has had the microprocessor replaced and now works on 10 and 12 meters. (You must have a valid amateur radio operator license to transmit with this radio.) Please email me for information on modifications. I recently had the final transistors replaced by a professional technician. He also tuned it up and made sure it was in good operating condition. It puts out a solid 10 watts on AM and FM and around 40 watts on sideband.

It will transmit and receive from 10 to 12 meters on CW, USB, LSB, AM, and FM. There are 4 separate bands with memories and will do split operation for 10 meter FM repeater operation.

Comes with the original hand microphone (UP/DOWN) in good shape, DC power cord, original operating manual and ChipSwitch manual.

Disclaimer: A previous owner has installed &#65533; inch high "legs" on the front edge of the bottom of the radio. Also, the original connector in the back has been altered by adding a toggle switch for internal/accessory speaker and RCA jacks. There is no mobile mounting bracket. Due to the type of equipment and age, it is being sold "AS IS" but not DOA.

$250 shipped , insured, to US address. I accept Pay-Pal or money orders only. Please email me for additional info or photos.

Mark

Since it's not moderated, it is EVERYONE'S job to moderate the
newsgroup. If you are going to open it up to regular off-topic
discussions, why even bother calling it.... screw it. I guess I'm the
only one that can think logically around here.

Ok. Then it's ok to talk about marijuana growing techniques, paper manufacturing processes, Lithium grease, and cubism. Why? Because these were topics I heard being discussed on the CB today. How are they relevent to the newsgroup? Because they were being discussed on the CB. Good enough? OK. Now don't EVEN complain about spam and flooding on the newsgroup, because they are topics that can be discussed on a CB radio! Get it? Good!

Professor,
If your amplifier uses a broadband/torroidal input
as most of the other amplifiers do, then it has as much
chance of being a bad mismatch as the rest. And as I
understand your amplifier is a 'kit', the chances of having
a terrible input match are even greater.
Good try though...
'Doc

As a matter of fact, I do. I am trying to think of a way to actually clamp the antenna to the tree. Do i get a chimney mount strap and just wrap around the tree? and then in turn mount the antenna on the strap? Any ideas? Also, would the tree inhibit the performance of the antenna (Block the signal)? Thanks

I was cleaning out the garage a couple weeks ago (where I store most of my CB radios), and ran across an old AST Premium Exec. This is an ancient 386 laptop with a 40 meg HD. One advantage is that it has a full 8-bit I/O parallel port for interfacing electronic projects. It could even be handy to log CB DX! Best offer.

Nope. NOT good enough. How quickly we forget what the initial quibble was all about. There ARE linear amplifiers that ARE manufactured for the purpose of being used on the CB and driven by a CB radio, hence they are CB amps. They may be illegal, yet they do exist and are open for discussion in a forum pertaining to CB activities.

Not exactly... even broadband matching can be done wrong....
My amp is not a kit at this time.

The tree will not block the signal much... but... you will impact your performance by having solid objects in close proximity with the antenna radiator. The antenna must be in "free space" to operate properly. That means to do it right, the antenna radiator must be above the tree branches...

Top the tree (cut off the upper portion of the tree) above the location of the mount and you should be good.

Hello J Rob:

I looked in my files of older antennas and I didn't see the Ringo Ranger.

I am sure if you contacted Cushcraft, they could send you the assembly directions. They are at:

http://www.cushcraft.com/amateur/support/instruction-manuals.htm

They list a PDF file for a AR-10, 10 Meter Ringo Antenna. I am sure you can contact them for the AR-11 Ringo Antenna.

But if not, the AR-10 assembly instructions show the main vertical element to be 200 inches, if you make this longer to say around 108 inches, and tune it around you should be able to tune for 11 meters. Or where ever you want.

Tell ya what, Bert. These discussions do exist on CB radios, and are
open for discussion on a forum pertaining to CB activities. Are CB's
used to talk about the weather? Sure! Then the weather is a relevent
topic for a CB discussion! Are some CB radios painted? You bet! So
painting is a topic relevent for a CB radio newsgroup. And aren't many
of these radios made with many different types of metals, like iron,
aluminum, antimony, tantalum, lead, tin, copper, zinc, etc?
Absolutely! So guess what? Metallurgy is open for discussion on
rec.radio.cb!!!

It's all the same difference, so you shouldn't have a problem with it.

Unless I am mistaken, fiberglass is R.F. transparent. Somebody please correct me if I am wrong. Regardless, I don't think a chunk of fiberglass would have much effect (if any) on signal transmission/reception. Catch you later.

>They list a PDF file for a AR-10, 10 Meter Ringo Antenna

I saw the PDF file (even printed it out) on the Ar-10 but it seems to be a little different in the area that I need to see. The one I have is in excellent shape except that I need to rebuild the shorting bar/gamma match and would like to see a detailed picture or drawing. The newer ones look like they use some sort of a matching coax stub in conjunction with the sliding bar. I am wondering if maybe I could just adapt the ar-10 matching device to the old timer.

Thanks for you input, RM~

This tree is rather large. Has all sorts of big branches up top, with green leaves and such...The heck with it,,I may just go with the eave mount on the side of the house, and call it a day..The only problem with an eave mount is that I can only use guy wire on 3 sides (As opposed to 4), because one side of the antenna doesn't face the house..It faces open space..I hope I explained that correctly.

Oh, don't get me started on Tyson. He might have been something "back in the day", but now? There are all types of people in this world, but, based on his many poorly chosen antics in the past, biting an ear, rape charges (I think?), jail time, and total disrespect, I find it hard to justify respecting a person's good athletic ability when he has done so much bad.

OK, to actually answer your question....Yes, he talks too much trash, he needs to go to work for Tyson Chicken, because he is one (a chicken, and a loser, in life and in the ring), hehe.

I hope Mike Tyson gets the mental health treatment he deserves.

Brian is still trying to break into the illegal amp market, and he
thinks this is be best place to advertise. That's HIS agenda, and you
are interfering with it! OH NO!!!

But really, if the FCC is planning on enforcing those laws I'm sure
they could set up to monitor Brian's email, so that way they could pin
down everyone that has purchased one of his splatterboxes. It would be
a quick and easy way to ring up some numbers on the enforcement page,
don't ya think?

To this end, I forwarded Riley the PDF file on Brian's "Skywave" where
it clearly shows the amp ships with 10 meter capability intact (in
violation of S2.815(b) and the specs show it designed for output
between 26-29 mhz(in violation of S2.815(b). If that wasn't enough, I
included several recent posts by Brian offering the amp for sale (in

violation of S2.815(b):

>>> http://members.core.com/~bgriffey/SkyWave%202879AB.pdf
>>> Only 2 Units left at Introductory $100 Offer !

I plan to email this at least once a month to Riley (with updates of
Brian's latest offers to sell) to keep the issue alive.

It is worth a try because the old ring was the weak point of all of them
including the stacked half-wave 2-meter versions where it was smaller.
The stub match will probably also make them a little less pissy about
weather.

If there were no Hams that read this newsgroup, then I might agree.
But quite a few CBers are Hams. Even if that were not true, there are
many articles in the newsletter that are of interest to CBers.

Hi, all. I have a question about the various "export" radios, and the various modifications that some companies perform on them.

First off, is it legal to just buy one of these radios? (yeah, I know, nobody just buys one of these radios and not ever uses them) You know what I mean, though...Is it just legal to have one on your person, even if it is strictly used for receiving purposes? (Yeah, like that ever happens, hehe)

Second, is it legal for the companies that sell these "export" radios to perform modifications such as "peaking" (obtaining wattage ratings? over 4 watts, or maybe even boost modulation to very high amounts) or performing the "extra" channel modifications?

Any legitimate info. and/or facts you could give me would be greatly appreciated. My own curiousity would be satisfied, as well as settling a slight disagreement between a friend and myself. Thanks for your time.

> you were cool. Live and learn...

Oh, go away Sparky. At least he provided some useful information.

I suspect that Dick knows that no amount of bitching by Hams, or anyone else, is going to get rid of the amps on the CB band. As such, the best he can do is try to help the amp users minimize interference to other services and possibly even to other CBers.

I am not a Ham, but I have often posted that if CBers insist on running illegal power, then they should use decent Ham equipment instead of the typical 11 meter splatterbox.

As a practical matter you are not ever likely to encounter enforcement unless you are really stupid. Pure ownership is perfectly legal although the marketing chain is not. You are dealing with bootleggers here and keeping your hand on your wallet is well-advised. Contrary to popular belief you do not have to be caught actually transmitting; the various laws and regs pretty much take the theory that quacking sounds are ducks so having it installed is pretty much the same as usage. If you are trucking, your employer may be less than happy with you when he firsts gets the warning, then a $10k bill.

Peaking is by and large a fraud. While there is some 'headroom' in rigs it ain't a lot and the accountants have made things pretty tight so about all you are likely to get is smoke. The alleged technician does things like disable the harmonic traps (harmonics are multiples of the operating

frequency) which look neat on meters but do you no good whatsoever and uses a meter that is calibrated in something other than water-heating watts. Good circus act but nothing I would be willing to pay for.

Extra channels are illegal per se. You should also be aware that things like 19 two up are in fact in Amateur frequencies and we have been known to be surly. This is an ace way to get your picture in the post office. Know what you are doing because you are off the reservation.

It is modulation where the real circus act begins. They will sell a theory of Amplitude Modulation that no one in the biz has believed since Coolidge was president. Fact: There is no way to get more than one half of carrier power on an AM signal by simple means. Fact: the rig out of the box does a pretty good job of it. Fact: cutting the limiter actually cuts average audio.
Yes, you can try to get more, but you generate crap that again looks peachy-keen on a meter but does no one any good and in fact is worse than the stock rig. Keep your hand on your wallet.

Buying this stuff is about like buying bottles of Dr. McGee's Elixir from the traveling medicine show. Probably won't kill you because they want to sell you more but it can make you poorer. When you feel your head going up and down, watch your wallet.

Dick N&#65533;BK, one of those oldie and moldy Extra Class Amateurs and generally cuddly Grandpa-type

Go for it, Frank. While I do believe that you're comparing apples to
oranges, it certainly wouldn't bother me enough to bemoan that it's
"inappropriate." Actually, it's much easier (& a whole lot saner) to

just pick the threads that one finds "appropriate" and just hop on in.
Ah, America...ain't she great!

73 de Bert
WA2SI

P.S. What's darn "inappropriate" is how the Lakers are beating the
stuffing out of my beloved NJ Nets. :'-(Take it easy, Frank.

Sure, what ever you say Frank.

Landshark

--
If you are implying that people, who
hold ham licenses, should be somehow
held to a higher moral standard than
the "common man", then that would
be faulty logic. A ham license is only
a "permit" to use radio, it is not a
"badge of morality".

Keith, Most virusi (!) take over a computer and a part of that take over is injecting offensive material in the attack mechanism and the distribution of itself to other unsuspecting users. The fact that you received an email from the person only indicates your email address may have been in their address book...or maybe you have made an enemy...hope it's not the latter.....

One more set of newsgroups Frank,
Alt.Autos. (All of them) There are plenty of
people on them promoting removing smog
devices, adding performance chips. They want
to by pass Federal EPA regulations, to which
is far more harmful to the world than the use
of a linear or export radio.

Subject: Re: what the hell is with channel " 6 "
From: Gringo_Loco24@webtv.net (C-h-u-l-i-t-o)
can someone explain to me how in the hell do those guys on channel " 6"
ever get any serious talking done<<

Someone can try, but it has been my experience that if one that needs
ask about the bowl after listening enough to form an opinion such as
yours, chances are they will not comprehend what takes place.

>all they do is speak that ebonics shit i mean yes its a free country
and ppl can speak how they wanna speak <<

If you wanted a sincere answer, why attempt to answer yourself. Kind of
makes one wonder why you bothered to post.

>but i just dont understand how they get any talking done<<

You appear to be a bit more interested in saying your piece than seeking
true answers, as you have now demonstrated a pattern of answering of
your own questions.

>i think they speak like that just to hear themselves talk<<

Well, then..since that is what you think, your mind is obviously made
up, there is really no need for soliciting others opinions unless you
are implying your beliefs can be easily be swayed by others.

>and to see which saounds the best (in their minds anyway) <<

And again.....

>...and they run so much power but its only on that 6<<

Try to find a radio that receives more than one channel. If you already
have one, it's time to upgrade the poor antenna system you have.

i dont know<<

To say the least.

>yeh i may be ignorant to this subject<<

Self-recognition is a step to education.

>but damn i just never understood why they have to get on there and
speak that way<<

Admittedly, you do not understand, yet your offering on the subject is
dismal..quite a non-feat. When one has readily admitted ignorance on a

subject, one should not attempt to expound on said subject.

>Twisty, george said 2kw which is 2000 watts <<

It wasn't pertinent to the question asked
what part are you missing, Geo?<<

>Geo's logic and reasoning.
wilsons specs say 2000 watts. <<

Yes they do.

>2 kw sounds like 2000 watts to me How about you or you can,t count that high<<

Again, it was not the answer to a "yes" or "no" question.

Hmmm..let's see..Tim helped me out immensely with a whole bunch of green questions I had concerning (ahem) transistors a few years ago

>I am sure he didt twisty, what would you know if he was telling you fact or fiction jeesh <<

We all know who puts forth fact and who puts forth fiction. What you feel is irrelevant, as you clearly demonstrate you have no clue how you are viewed by others. The other scenario going on with you is even more grim.

>Wilson "500" Specificationsa.. 2000 Watt power handling capability (ICAS)
=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0a.. Made with high impact Thermoplastic
=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0a.. Heavy duty coil uses 12 gauge copper wire
=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0a.. Exclusive low loss coil design (Patent #4,882,591) - Same as
Wilson 1000
=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0a.. 54" 17-7 PH stainless steel whip
=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0a.. 2 year warranty
=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0a.. Frequency range 26 MHz to 30 MHz
=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0a.. Weather Channel Ready<<
(Chuckle)

The frequency ranges, as I am certain you are aware, can be even further manipulated to a certain extent with the Wilsons.
sure twisty we all know how to trim a shorten or lengthen a whip, or

remove part of the coil<<

Going by that logic there would be no need for you reiterate the wattage ratings.

>stick to catching fish<<

Once in awhile. Mostly clients catching them these days.

>leave the radios to the technicans <<

I do, that's why my station sounds so damn good.

I'm with you on the SSB only thing, good deal. However, on the channel 6 "splatterbowl"...the stations that are "getting thru" are those who are doing something wrong, just with a heckuva lot more horsepower behind them. I've actually tried to listen in on a QSO(?) or two and two things are readily apparent.

1. The participants have little, if any, consideration for anybody else who wants to use any of the frequencies adjacent to their "competitions."

2. Readability of one's signal is, at best, an afterthought. One can actually discern the distortion. (A mean feat.) Loud audio is not necessarily clean "readable" audio from a true QSO standpoint. Just because one could make out "superstar Sam Cooke in the mobile!!!" six miles away over all the other "noise," doesn't make Sam's signal better...just brutally stronger. Sorry, no credit given here. (Not that it should matter to them.) Now talk to Japan with approx. 17 watts on channel 38 LSB with many other stations attempting to do the same and confirm the QSO with a QSL card postmarked from Kadena AFB in Okinawa! (And NOBODY except those on the frequency at the time know about it, thanks to the low pass filter and well designed station.) IMHO, now you're saying something!

Just as an additional FYI; notice that both activities described above violate the FCC rules governing the CB, Part 95. HOWEVER, who would you rather have for a neighbor? I am neither "keyclown" nor saint...just a reasonable soul residing in the real world.

thing is i do leave them aloen a person cant help but sit back and only listen which brings me up to another point they may think its some big bad competition to show who is the baddest withe the biggest ..buts its more of an unecessary use of equipment and illegal

true there are many things today that we cb/ers do that are illegal however that so called competition as its put is about as rediculous as it gets

Heheh...
I'd have a real problem installing anything that has it's electronic
parts covered in some sort of goo. Interesting way to try to protect
your design (or to hide the fact from people they just bought about 10
worth of parts. :)
I've seen that make it through a couple of times, but nobody ever seems
to either bid or make the reserve price. Methinks they want too much
money for it.

OK, why did you decide to come here and start trolling yanks instead
of trolling in your own UK group?

>

They are merely aghast that the consequences of your trolling yanks
followed you home.

I've been listening to CB a long time and I've never heard classic
literature being discussed. What channel was that? :)

> I
> never could stay awake past the first chapter, so does anyone have a
> take on it?

In general, it concerns a group of English schoolboys accidentally
marooned on a tropical island. Lacking adult supervision, the group
quickly degenerates into a primitive culture based on ignorance,
superstition, and escalating violence directed against weaker members
of the group. When rescuers finally arrive, the boys not only succumb
to adult authority, they welcome it.

Only for vibration resistance. Any design electronics that are to be
kept out of the hands of the enemy usually have a little X on the case
where you shoot it with your .45 (or 9mm nowdays) before you get
overrun.

> As for the price...
>you are not paying for the components alone... you are paying for the design

>you have the expertise, then build one yourself...

That's why they have copyright and patent laws. Conformal coating is
all too often used to cheat the consumer. As stated before, it can be
used to hide simple and cheap designs so they can hike up the price.
It has also been used to "black box" circuits, making them serviceable
only by the module and not by the component, and securing a secondary
market for the product in repair parts. A certain unnamed Japanese
company is notorious for doing the latter.

ï¿½
FCC ISSUES REMINDER ABOUT HF TRANSCEIVERS
ï¿½
The FCC has issued a friendly reminder about those HF transceivers
ostensibly marketed for "amateur" use, but actually designed and
intended specifically for the so-called "freeband" radio operators,
who operate primarily in the 26 to 28 MHz frequency range.
ï¿½
In a May 13 Public Notice, the FCC points out that it's a violation of
FCC regulations to import or market a transmitter designed or intended
to operate outside the amateur bands unless the equipment has been
issued a grant of equipment authorization for the radio services it's
capable of operating. The FCC says it wanted to clarify its rules on
equipment that's "intended to operate in various radio services in the
high frequency radio spectrum, including '10-meter' Amateur Radio
Service (ARS) equipment." The notice--directed to "manufacturers,
importers, vendors and users of these transceivers"--emphasizes that
transmitters intended for use by FCC-authorized radio services except
the Amateur Radio Service must be type-accepted.
ï¿½
In the words of the Public Notice: "The Commission considers that the
transceivers discussed above are intended to be operated on
frequencies where the use of type-accepted equipment is required,
because of the simplicity of modifying them to extend their operating
frequency range."
ï¿½
The FCC also noted that it's illegal to import, market or operate a
transmitter that requires a grant of equipment authorization but for
which no grant has been issued, and that it's a violation to transmit
on frequencies allocated to a licensed radio service "without the

appropriate Commission-issued station license." Violators could be subject to fines or imprisonment as well as equipment seizure and forfeiture.--FCC

> Why stop there? The Icom 746 will do 100 watts there. <g>

Well it can do more than 100 watts too

POWER MOD For Icom 746
****
Remove bottom cover.

Find the voice module plug-in.Right behind it you will see 4 pots

R993 144 mhz power adj
R991 50 mhz power adj
R989 HF bands power adj
R990 AM power adj

You can tweak these to up the power suggest on hf doing it on 40 meters. you
can get close to180 watts on 40-75 meters about 125 to 150 on 20-10.

The pots are very small be careful not to use something to big. the are all
metal pots.

What a weekend, some big time partying , barbequeing sumna bitches at these Nascar races. Motor Home is the only way to go I got more ass than a toliet seat, saw a decent race, tough part is you can't see the whole track and did get to go to the garage on Saturday, before Happy Hour and got to meet some of the drivers, lotta little phuqqers they are.Oh you should have heard the rednecks on there GMRS radios, thougth it was 11 meters. Ok now for the real question Who Missed me?

From: Van Random <566@fd.net>
Message-ID: <ugado01jgpo892@corp.supernews.com>
Source record: 127164

I have one in my truck which has never functioned. Became interested in making it work, and followed its two cords all the way to the inside of the hood of my truck. The black wire is hooked to a metal piece in my truck (I guess like a ground)
The other wire is near my battery, not attatched to anything.
Should I hook this wire to my battery? Help.

I know nothing about this shit, just want my CB working without doing something that will fuck it or me up.

Yes, but only after checking to make sure that there is a fuse inline
with the red wire. It should be about a three amp fuse.

1269. New Stupid Question!

Newsgroup: rec.radio.cb
Date: 2002-06-11 00:00:00 UTC
From: Van Random <566@fd.net>
Message-ID: <ugafd7kl1e7hdd@corp.supernews.com>
Source record: 127168

This CB radio (a Midland something) has no apparent way to change channels! It has a red button for Ch 9, but nothing else. I have yet to get a mike too.

How do I change channels? They are listed on the front, but it will not change them! There are no other knobs or buttons other than the red "9" button. Is it possible this feature is one the mike or something???? (not knowing shit about CB)

Not a problem, the two MURS stations running 2W, simply point their
12dB gain antennas at each other, and we simply ignore the fool.

If someone goes with an external power amplifier, we'll have to go
with higher gain beams.

77-106 is one of them TINY little radios if memory servers me correct. It
should have up and down buttons on the front of the radio. If it does not, you
might do better just getting another radio unless you can find the stock mic
for THAT radio with the channel buttons.
Train

Hello Dick:

Back in the Mid 60's I built a amp that used 2 each 6JE6C's grounded grid, built on a chassie, with surplus parts, ect.

The neat thing was I got extra credit from my Electronics Class in High School, the teacher thought it was pretty neat-O. Had the tubes is aluminum box with screen door type screen over it, with a small muffin fan.

But The really neat thing was the tuning indictaor was a GE #47 Bulb, that was in seriers with the output circuit, that was shunted by 2 1/2 turns of wire, around a Pencile. When you would adjust the Tune or Load the light, it indicated the antenna current, and had a orra of really being neat, especially housed inside a very large Jewelled Indictor Lens. Tune for "Max Brightness", the Dyno Lable said.

It wasn't really a power house, 30 to 40 watts out, the ol man ran it for years and years.

Outstanding. I ordered a 10 meter rig from them and it came in modified for CB. I'm not against CB in any way but when you place an order for a particular item your should get what you ask for. They Copper refused to return my calls (6 in total) or replace the radio so I filed a complaint with the FCC turned all my papers over to them and offered them to inspect the radio.

Hi all. I notice that Radio Shack has a 36 ft. mast for like $70. It is 4 sections that interlock. I was thinking of getting this mast to mount my Shakesphere CB Base antenna. I will be mounting from the ground up, so that is why I would need 36 ft. I normally don't go to Radio Shack for many things, but I was just curious if any one had any real world experience with this particular mast. Also, Radio shack has that 8 gauge silver colored gorund wire. Would that be good wire to use to ground my antenna? along with the 8 ft. ground rod they have? Thanks.

What do you mean? You ordered XXXXX brand 10 meter only radio, but they sent it to you already modified? If so, that's a bit odd, considering you didn't ask for the mod. On one hand, I guess it was "nice" of them to do the mod for free (only assuming you had planned on doing a C.B. radio mod/peak/tune yourself at a later date, but didn't want to spend $30 on the mod.) But on the other hand, regardless of my intentions with a radio I buy, I want an untouched radio when I order it. No mods, peak, tune, etc. I seriously doubt the mod. was factory done, though, hehe.

Out of curiousity, what rig did you order? Thanks.

This is wrong. It is not a DC potential. You need to measure the
magnitude of an AC voltage. When standing waves exist, the
magnitude of the AC voltage varies along the transmission line.
There is no DC potential to be found.

> voltmeter.

That would be a trick. You need an AC voltmeter to measure this
AC voltage.

> The ratio between forward power and reflected power is called the
> standing wave ratio, or SWR.

Sort of, but not technically correct. SWR is a function of the
forward/reflected power ratio but is not equal to it. The forward/
reflected power ratio can be determined from the SWR and vice versa.

> The higher the SWR, the more power that is
> reflected back into the transmitter. (More accurately, this is called the
> Voltage Standing Wave Ratio, or VSWR, and is the ratio of the maximum
> voltage to the minimum voltage along the standing wave.)

Why is this more accurate? A current SWR exists as well; this is no
less accurate.

> How Do Power Meters Work?
> An inductive pickup wire is placed very close, and parallel to, the center
> conductor of the coax. The signal from this pickup wire is rectified,
> filtered, and sent to a meter. If the signal is rectified in one direction
> the meter will read forward power, and if the signal is rectified in the
> opposite direction the meter will read reflected power. It's that simple.

Not exactly accurate. An inductive pickup senses current. There
is an alternating current. If you rectify it one way, you get the
positive portion of the alternating current; if you rectify it the other
way, you get the negative portion of the alternating current. Both
signals are equal in magnitude. Such a system would not provide a
directional measurment.

While SWR meters are not complicated, your description is grossly
simplistic. In actuality, the inductive pickup also provides
capacitive coupling to the signal to simultaneously sample both
current and voltage. For forward power, the voltage and current

are in phase and sum together for a reading. For reverse power, the
voltage and current are 180 degrees out of phase. When summed together,
they cancel each other out and provide no contribution to the reading.
Thus, the SWR meter is directional; it measures power in a single
direction.

> Now remember that the power meter works from an inductive pickup wire, which
> means the meter is actually picking up the signal's current from the
> transmission line. When a standing wave is present, the meter will be
> reading the current from the forward power, but it will also be reading the

>
> So in a nutshell: When the standing wave current is low the SWR meter will
> show less than true reflected power, and when the current is high the meter
> will read high.

This is all wrong because your premise ("works from an inductive pickup
wire") does not accurately describe the true operating mode.

> ...the best place to measure
> SWR is at the point of mismatch -- the connection between the coax and
> antenna -- where the phase relationships between the forward and reflected
> signals will always be the same.

Again, this is incorrect for the reasons mentioned above. And placing
the meter where the coax meets the antenna is often not practical.

> It is important to note that SWR does not vary at all along the coax, and
> neither does forward and reflected power. What changes is the observed SWR,
> which is a limitation in the design of the meter.

Not true. Your understanding of the meter is flawed; not the meter.

> All this can be proven by doing a very simple CB experiment. Take two runs

> coax, but the SWR at the transmitter/coax connection will be noticeably
> different. This experiment assumes that everything else is the same for both
> lengths of coax, and everything works properly.

Be sure to use connectors that are 50 ohms impedance for this
experiment. PL-259 connectors are not 50 ohms.
And be sure your coax is truly 50 ohms impedance -- don't rely on
what Radio Shack says it is.
If all of your components for this experiment are truly 50 ohms, the
SWR reading will not change.

> Why Does Everyone Say I Need 18 Feet of Coax?
> One common deception among CB antenna manufacturers is by them using the
> standing wave to their advantage. The impedance of CB antennas is typically
> lower than 50 ohms...

This is an assumption which cannot be guaranteed to be true.

> which means that the current of the standing wave will
> be at it's maximum at the point of mismatch.

This claim is based on an assumed premise.

Not true.

The antenna manufacturers wish it were that easy.

Now, you are really talking bullcrap. Where do you get this stuff?
There is no departure from the characteristic impedance of the coax.
Standing waves have absolutely no contribution to radiating coax.
It is possible to have standing waves with near zero radiation.

> If the coax is only designed to work

> Radiating coax is not desireable unless it is intentional.

This is total bullshit. You are talking out your ass.
The coax impedance dictates the voltage/current relationship of
the signals that it carries. If you were to look at the forward
and reflected power independently, you will find that the forward
voltage/forward current ALWAYS EQUALS the characteristic impedance.
Conversely, the reflected voltage/reflected current ALWAYS EQUALS the

characteristic impedance. The individual signals NEVER CHANGE IMPEDANCE. It is only the sum of the two signals that gives an apparent impedance that can be different than the characteristic impedance.

This is wrong. It is not a DC potential. You need to measure the
magnitude of an AC voltage. When standing waves exist, the
magnitude of the AC voltage varies along the transmission line.
There is no DC potential to be found.

Hmmm..........

Well, if he can prove that he has a military contract for D-104 Microphone
impedence matchers then I think you'll have a valid argument... Otherwise
this is a Red Herring... There's no reason for the goop to be sprayed all
over the board unless he's trying to hide something (at least that's my
reasoning behind it).
Also, I love the hand-written masking tape that marks the output wires...
Gives it that 'homebrewed' feel. ;)

> As for the price...
> you are not paying for the components alone... you are paying for the design
> development. It's called R&D. I think the device is a good, simple idea. If
> you have the expertise, then build one yourself...

Well, since my Silver Eagle already has all the onboard circuitry it needs
(without any trace of spray goop in it), I think I'll hold off on installing
any 'Magic Fixes' for my Mic...
I'll take your advice though... I'll build my own before I ever pay over
$10.95 for that thing..
Besides, how much design goes into an impedence matcher??? Ooh... You swap
parts until you get the output impedence you're looking for (or just use
variable resistors)... Yowch, real hard there...
Anyway, I wasn't looking for a fight, I was actually trying to poke a little
fun at it... The overpriced, meringue-coated doodad that it is...

Hi all,

I'm searching for the schematic diagram for a Realistic TRC-2005. This is a 27MHz FM CB made for UK (so I believe). If anyone has, or knows where I can get, a copy of
the schematic for this CB please e-mail me.

Thanks

>less accurate.

I didn't say that ISWR was any less accurate than VSWR. I said that
VSWR is a more accurate expression of standing waves, and you would
have understood that in the context it was written if you hadn't split
the context in which it was written.

>> How Do Power Meters Work?

>
>While SWR meters are not complicated, your description is grossly
>simplistic. In actuality, the inductive pickup also provides
>capacitive coupling to the signal to simultaneously sample both
>current and voltage.

Not on any meter I have ever seen. There is some capacitive coupling,
but the capacitance is small, it's effect on the reading is
negligible, and its effect is usually not intended to be measured.

> For forward power, the voltage and current
>are in phase and sum together for a reading. For reverse power, the
>voltage and current are 180 degrees out of phase. When summed together,
>they cancel each other out and provide no contribution to the reading.
>Thus, the SWR meter is directional; it measures power in a single
>direction.

I don't think so, CLP. The voltage and current of the forward power
are directly opposed (180 degrees, assuming a non-reactive source),
and the phase of the components of the reflected power is shifted from
that of the forward power according to the reactance of the load. And
it is the positive or negative phase shift of the current wave along a
length of the pickup that causes the directional characteristics of
the induced current in the pickup wire.

IOW, if the current at point A on a transmission line reaches it's
peak before it peaks at point B (caused by forward power, for the sake
of argument), the current will flow in a specific direction in the
pickup wire; conversely, if the current peaks at point B before point
A (from reflected power), then the current in the pickup wire will
flow in the opposite direction. And THAT'S what makes power meters
work.

You can build a power meter that works by capacitive coupling, and I'm
sure many people have already done so. The effect is the same. But any
power meter that uses both capacitive and inductive coupling is going
to get some very skewed readings when phase isn't perfect.

>> Now remember that the power meter works from an inductive pickup wire, which
>> means the meter is actually picking up the signal's current from the
>> transmission line. When a standing wave is present, the meter will be
>> reading the current from the forward power, but it will also be reading the
>> current from the standing wave. The current from the standing wave may be
>> large or small, depending upon where the meter is located along the standing

>>
>> So in a nutshell: When the standing wave current is low the SWR meter will
>> show less than true reflected power, and when the current is high the meter
>> will read high.
>
>This is all wrong because your premise ("works from an inductive pickup
>wire") does not accurately describe the true operating mode.

The premise IS accurate, as stated above. Additionally, since both the
forward and reflected powers are propagated at the impedance of the
transmission line, there is no point in reading both the voltage -and-
current; that is, unless you were interested in the voltage/current
phase relationship of the resulting signal on the transmission line.

And that is where you seem to get lost. The forward power will read as
forward power regardless of reflected power, and vice-versa. That is
because the voltage (and current) waves are still there but
superimposed on each other. While the o-scope might show a distorted
waveform, it is still only two sine waves. But power meters do not
read instantaneous voltages or currents, they read voltages or
currents averaged over time. And since the interaction between forward
and reflected power, the standing wave, is a function in the time
domain, standing waves will be read concurrently with whatever
direction of power the meter is reading. If you happen to be reading
forward or reflected power at a standing wave current node, then your
readings will probably be accurate because of no standing wave
interference. But if you are reading power on the leading or trailing
slope of the antinode, then your power measurements are going to be
skewed up or down accordingly.

I hope that cleared things up for you. If I wanted to do a complete EM
analysis of power meters I would have either done so, told the reader
to do so himself, or provided instructions on the use of an
oscilliscope.

>> ...the best place to measure
>> SWR is at the point of mismatch -- the connection between the coax and
>> antenna -- where the phase relationships between the forward and reflected
>> signals will always be the same.
>
>Again, this is incorrect for the reasons mentioned above. And placing
>the meter where the coax meets the antenna is often not practical.

It may not always be practical, but it is the most accurate method to
measure both forward and reflected power, not just because it is
difficult to find a node, but also because if any reactance is present

in the load the nodes are going to be that much harder to find. And
even then it might not be accurate because of phase shift caused by a
reactive load, causing a proportional phase shift in the standing
wave. Like I said, it's best to measure it at the load.

>> It is important to note that SWR does not vary at all along the coax, and
>> neither does forward and reflected power. What changes is the observed SWR,
>> which is a limitation in the design of the meter.
>
>Not true. Your understanding of the meter is flawed; not the meter.

It is very true. Forward power doesn't change. Reflected power doesn't
change. Therefore, SWR doesn't change. And if you want proof that the
OBSERVED SWR changes along the transmission line under mismatch
conditions, do the experiment yourself (gee, didn't I say that many
moons ago?)

>> All this can be proven by doing a very simple CB experiment. Take two runs
>> of coax that are about 3 feet different in length. Select one and connect it
>> to a transmitter (of the same impedance) and to an antenna or dummy load

>> different. This experiment assumes that everything else is the same for both
>> lengths of coax, and everything works properly.
>
>Be sure to use connectors that are 50 ohms impedance for this
>experiment. PL-259 connectors are not 50 ohms.

PL-259/SO-239 connectors, aka UHF connectors, add no measurable
mismatch to a transmission line. If they did, they wouldn't be used as
commonly as they are these days. Regardless, since there is no
difference in the number of connectors used in the two parts of the
experiment, any confound caused by connector impedance mismatch is
eliminated.

>And be sure your coax is truly 50 ohms impedance -- don't rely on
>what Radio Shack says it is.

No shit!

>If all of your components for this experiment are truly 50 ohms, the
>SWR reading will not change.

Indeed it will, and you would have seen so if you had actually done
the experiment. You can search for alternative explanations or
insignificant confounds all you like, but the effect happens, and it
happens with regular and predictable results.

>> Why Does Everyone Say I Need 18 Feet of Coax?
>> One common deception among CB antenna manufacturers is by them using the
>> standing wave to their advantage. The impedance of CB antennas is typically
>> lower than 50 ohms...
>
>This is an assumption which cannot be guaranteed to be true.

True, but very rarely have I found a 1/4 wave mobile antenna to be
higher than 50 ohms. When that happened it was usually because of an
error in the antenna or test equipment. But while I'm not ruling out
the possibility, I can safely say that very few people are going to
run into that situation.

I should add that I'm not considering a loaded whip, and I'll amend
the page accordingly when I get a round tuit.

And I should also point out that the first statement in that last
quote is one of my biggest mistakes yet. More below.

>> which means that the current of the standing wave will
>> be at it's maximum at the point of mismatch.
>
>This claim is based on an assumed premise.
>
>> But at one-quarter wavelength
>> away from the antenna, and every half-wavelength thereafter, the current is
>> at it's minimum. At these points a SWR meter will read lower than true value
>> s, making the antenna appear to perform better than it actually does.
>
>Not true.

You are absolutely right. When the match is low, the current nodes are
at 1/4, 3/4, 5/4, etc. wavelengths from the point of mismatch. It is
at these points where power measurements are the MOST ACCURATE, not
the most skewed as I previously stated.

>> Now,
>> using the standard 50 ohm coax with a velocity factor of 66%, three-quarters
>> of a wavelength is equivalent to 18 feet. This is the length of coax
>> recommended by so many of the CB antenna manufacturers. Using this length of
>> coax will effectively 'fool' any SWR meter located at the transmitter into
>> thinking that the reflected power is lower than it actually is, to the
>> benefit of the antenna manufacturers.
>
>The antenna manufacturers wish it were that easy.

That was my mistake. The antenna manufacturers are not recommending 18
feet to deceive, but to ensure accuracy of SWR measurements. Measuring
SWR -away- from the nodes will skew the readings. I don't know why I
never realized this before -- probably blinded by cynicism. In either
case, I always measure power at the load, and then I don't have to
worry about nodes one way or the other.

>> How Can A Coax Radiate?
>> A coax cable works correctly when all of the RF power is contained within
>> the shield. When standing waves are present, the resulting fluctuation of
>> signal impedance creates a problem, because the signal departs from the
>> characteristic impedance of the coax.
>
>Now, you are really talking bullcrap. Where do you get this stuff?
>There is no departure from the characteristic impedance of the coax.

When the voltages of the forward and reflected power are in-phase they
add; when that happens the currents will be out-of-phase so they
subtract. If you are increasing your voltage while decreasing your
current you are increasing your impedance. The same thing happens in
reverse when the currents are in-phase and the voltages are
out-of-phase -- the impedance of the standing wave decreases. The
impedances of the forward and reflected powers do not change, but the
impedance deviation of the standing wave is directly proportional to
the SWR. This is nothing more than simple math.

>Standing waves have absolutely no contribution to radiating coax.
>It is possible to have standing waves with near zero radiation.

...hehe... yeah, right...

>> If the coax is only designed to work
>> with signals of 50 ohms impedance, but the signal is not 50 ohms, or
>> fluctuates as it does in the presence of standing waves, the coax will not
>> work correctly. If the coax does not work correctly, for whatever reason,
>> the RF containment fails, and the shield will begin to conduct RF. So when
>> the antenna is not matched to the coax, the coax radiates. This can be
>> easily tested with a field strength meter, which shows this to be the case.
>> Radiating coax is not desireable unless it is intentional.
>
>This is total bullshit. You are talking out your ass.
>The coax impedance dictates the voltage/current relationship of
>the signals that it carries.

The coax impedance dictates nothing -- that is the "characteristic"
impedance of the transmission line; meaning that if the coax impedance
is 50 ohms, it works properly when the signal is 50 ohms. It DOESN'T
mean that you can pump in any impedance you want and it will magically
transform it to 50 ohms.

> If you were to look at the forward
>and reflected power independently, you will find that the forward
>voltage/forward current ALWAYS EQUALS the characteristic impedance.
>Conversely, the reflected voltage/reflected current ALWAYS EQUALS the
>characteristic impedance. The individual signals NEVER CHANGE
>IMPEDANCE. It is only the sum of the two signals that gives an
>apparent impedance that can be different than the characteristic
>impedance.

It is not an "apparent" impedance. It is the real impedance of the very real standing wave. Or, more appropriately, it is the real impedance deviation along the length of a standing wave. You might even call it ZSWR. Hmmm...not a bad idea...

Hi Rob,

The 11-meter (Or CB, as some prefer.) version of the Cushcraft AR-10
Ringo Ranger 10-meter 1/2-wave vertical was called the CX-1000. If you
call or write Cushcraft they may still have an assy. manual around and
just might agree to send you a copy. Good luck. :-)

Those circular loops are called anchors, are usually 6 to 8 feet long, and screw into the ground typically. You might be able to find some smaller anchors at a manufactured housing outlet.

> The pots are very small be careful not to use something to big. the are all
> metal pots.

And then one has to wonder why, if the rig is capable of 180 watts, why
Icom didn't ship it that way?

Could it be that running it at 180 watts can:

Severely shorten the life of the transmit finals?
Result in increased spurious emissions or IMD products?
Create more heat than the heatsink can handle, exposing the rest of the
rig to high temperatures and possible failures?
Exceeding the current draw ratings which could cause PC traces to burn?
Exceeding the RF power rating for the relays, PIN diodes and other band
matching components?

Just because it can doesn't mean it should.

I always laugh at screwdriver technicians circumventing good engineering
practice......

The matching loop is all-important on these. If it's broken, missing parts, or adjusted incorrectly, the antenna is worthless.

Damn! I remember when this one was $24.99!

Forget Radio Shack. Get a 50-foot (actually 46 foot) Rohn, if you can find one. Even if you don't need the extra height, go with the 50-footer. Reason? The bottom section is larger in diameter and thus stronger than the shorter versions.

Now you have absolutely no credibility on this group and are nothing
more than a racist punk. You were not just asking questions you were
starting trouble. I think everybody who visits this group for the last
8 years should know that channel 6 is a competition channel only. Now
if that is not your cup of tea and you are not a free bander.... you
have 39 other channels not including sideband to talk on.

From: Gringo_Loco24@webtv.net (C-h-u-l-i-t-o) >well all i did was voice my opinion and question<<

No, that's not all you did at all. You come into a cb forum and stratred complaining and whining about an aspect it offers and now you want to cry foul because someone challenged your method. Too bad.
NOW you call it an opinion. Before you were coming across like you wanted genuine information when all you wanted was to cry about channel 6. Probably because you couldn't get out.

>i didnt do it an uptight smartass way i dont think<<

Reread your comments. You did it in a way that showed your were seeking NOTHING despite what you claimed. All you wanted to do was rant, which is fine, but don't act like a spoiled child when it is realized for what it is.

>but it never fails there are always ppl who have this dickhead mantallity<<

The choice of vernacular tells everything we need to know, including how correct I was concerning your original post. If there was any doubt, the 'Dickhead mantallity (SIC)" comment reasserts your position with no doubt.
The juvenile tactile behavior of instant profanity when one questions a post makes you trouble from the get-go.

>about them that they cant resist putting other ppl down to make themselves feel good
  ....usually once they start in on a perosn then there goes the chain reaction of pissing ppl off and resulting in them going down to the pricks level so if thats what i ahve to do then so be it ..i come in here and try to be nice<<

Oh, bullshit..you came in here whining about channel six searching for a reaction and got one. Grow up, child.

>but obviously theres an A?HOLE in every bunch <<

You have been duly noted.

>that person knows who he is <<

Gee, more identity games? Have at it.

>...and i do appreciate the ones who have
been respectful to me ....just because i am not up to par on some things as others does that give someone a right to put them down i think not<<

Same with you and channel 6. Just because you are ignorant about it, you felt you had a right to put it down..hypocrite.
No one has put you down nor needs to....you put yourself down quite nicely. You come in here and made some comments concerning something you apparently take disdain with and were met with an opposite point of view. This was met by you with foul profanity and childish name calling. Grow up or go sit in the corner. If you think for one minute you have managed to share a single redeeming quality with yur language, temper, and inability to control yourself when someone questions your posts, maybe usenet isn't for you.

Twisted, is there any connection between your hate-posting of this story
about a ham/Fire Dept. Volunteer<<

You forgot licensed hammie.
What part of the link did you misinterpret as hateful?
Actually, Frank, anytime a cber does anything wrong, you or JerryO take
pleasure in posting it but never post the hammie screw-ups. Why am I not
surprised you immediately went on the defense of this guy when his
misdeed was posted for all to see.....is it because he is a hammie,
Frank? What this parasite did is more despicable than anything you have
ever cried about concerning amps and cb.

> posted
/ARES member accused of child molestation.....and Keith Hosman getting a
virus with child porn in the mail the same day?
-A<<

I would be very careful associating Keith with such activity. Makes one
wonder how you even arrived at such a connection. Keith may like to play
around on the web, but this is not a joke. Only one of your ilk (oh yea,
and Lelnad, too) would dare joke about such vile acts committed against
children. This beast used his professional stature as a firefighter to
wiggle his way into an explorer scout group to get near children. It's
almost sick how you take issue with informing those who may come into
contact with this pervert about his actions as a form of hate.
Besides, you are the one that has been told by many to stay out of their
mailboxes and can't seem to listen. Your email has even changed several
times due to incorrect behavior. I suggest you email MSN and inquire
about the webtv service, as I suggested once before, if you are again
worried about such things as viruses. Webtv is guaranteed against such
things..can't get them, therefore can't pass them on. Educate yourself.
Or you can always talk to Keith yourself.

Lately, I have noticed a peculiar antenna on big rigs. It is black, about
3-4' tall, 1/2 to
3/4" dia, and has a sword-shaped tip, or a slender "cone" shape at the top.
Anybody
know what that is?

Jerry

Skipp,

Eating lunch and reading the mail........

Looked at your pictures.

Very interesting!

Hope his keydown time is very short because the fan he is using does not work well against any sort of backpressure; so I seriously doubt that he is getting adequate and proper airflow through the cooling fins of those tubes.

Are you sure those were 4CX250's?

If they were he should have needed another transformer for the screen and bias supplies that I didn't see anywhere in the PIX.

Maybe those tubes were 3CX400A7/8874's.........(or their Russian Equivalents)....which do not need the extra supplies.

I think that an easier way to do that mod would have been to use a single 3CX800 there, with less backpressure and more plate dissipation and without the need for any additional screen and bias supplies.

Regards,

Dennis O.

Yer dreamin'. For example, Why don't you tell Joe Walsh of the Eagles band
that?
He's a ham. I've had email exchanges with him. Would you have told Chet
Atkins
that prior to his death? Also a ham. How about Walter Cronkite? Another
ham.
How about Senator Barry Goldwater--also a ham before his death? Ditto for
Arthur
Godfrey. Think he was a "geek" who had no life. How about the time he got
in dutch
with FAA for buzzing the Teterboro, NJ tower?

> around the world.

Another dream. Refer back to the first paragraph. Those few, out of
thousands of
the famous and not so famous, are multi-millionaires and have none of the
negative
characteristics you claim. And there IS a CB place not too far away where

the guy
DOES weigh 400 lbs, lives and works in a dingy little trailer, drinks tea constantly,
smokes cigars, rides one of those battery scooters, and swats roaches interspersed
between doing those illegal mods to CB sets. The place is dimly lighted, one can barely
walk thru the front door to the front end bedroom he has converted to a shop for all the
junk radios and newspapers piled high. There is a narrow path thru the kitchen amongst
the unwashed dishes and empty tin cans he eats out of so his scooter can get thru to
where he sleeps (and I ain't going back there <shudder>). He ekes out a bare living
working on CB sets, tho the issue of "repair" is a bit questionable. Most hams I have met, with a few exceptions, are highly successful, professional people such as salesmen,
computer techs, railroad employees (like me hehe), secretaries, wives of professional
persons, also the inverse, and even executives who find ham radio relaxing. Oh, but I
can understand why you think that all there is to radio is talking considering how you
are a CBer and that is the entire (empty) gist of the hobby. Never mind that many hams
spend time BUILDING their own complex projects (and I did NOT say that there were
not CBers that did the same--I am responding to an insult in kind), or STUDYING theory--LEARNING something about the hobby instead of "10-4 THAR, Ah know
whutcha mean thar, shore do thar, mercy me thar, gre't day 'live thar, I heerd that, ah did" ad nauseaum. Oh, don't forget SQUEAK!! BEEP!! Echo, echo, echo, echo,
echo..... And amongst the $60,000-$100,000 types, whether they indulge in a radio hobby or not, the CB hobby will never escape the trailer park, cotton mill, junk car-with-the-huge-whip image. You know, the one whose engine goes FOOP, FOOP, FOOP, FOOP, FOOP, running on about 5 out of 8 cyls. LOL! Yeah,
I can understand why *some* people would never grasp the entire scope of the Amateur hobby because all they know is TURN ALL THEM KNOBS ALL THE WAY TO TH' RA'HT, MAKE HIT SMOKE, LIGHT MAH 'FAR', TREETOP TALL, PEDAL TO TH' 'MEDAL', etc. Their focus is yap, yap, yap, yap, yap, yap, yap, uh oh, that thang a-quit workin'.

The clerk liked it when
> I needed a new Astatic mic and asked me if I was a ham and my reply was
> "No I have a life, wife and a
> real job.

Again, see above. Not that all CBers are in poverty (remember, I am responding to this
in kind), but I have rarely to see a "poor" ham. Me, I was able to retire early due partly
due to a buyout, and partly due to disability. I make the same thing (take home) I used
to take home after taxes while working--except I do what I please now. I don't even
get "socialistic insecurity" because I didn't pay into it. Radio isn't my entire life. I enjoy
sports, skating, cars, flying airplanes, going to events, light travel, woodworking (I have
a pretty extensive shop), and exercise. My shack, while not the envy of the radio world, consists of Atlas, Heathkit, Icom, Swan, and Radio Shack stuff. I have diagnostic tools
such as B&W dummy load/watt meter, Swan WM2000A peak-reading wattmeter, Heath Oscilloscope, MFJ Analyzer, and a host of other equipment that makes a shack
convenient and usable. I don't stay on the radio until the wee hours, either. Yesterday,
for an example of an activity, I went to the Lewis Racing Shops that owns the #46 Chevrolet that runs on the Busch circuit and met the driver, Ashton Lewis. The car is
sponsored by an organization I belong to. So, I, for one, and lots of hams, aren't "hermits" who hole up in their shacks. I am single, own a fairly sporty car, and spend time in the company of various women going to some of the activities I mentioned above. Oh, I do like to build my own line of Amateur HF mobile antennas which are
on the web at www.qsl.net/k4kwh .

> 3. Also who else would be driving around in his 73 Plymouth duster at 2:00
> am with radio equipment trying to
> catch working AMERICANS making a living and keeping this country moving
> while trying to talk to FELLOW
> AMERICANS WORKING and trying to keep the boredom at bay.

The CBer example I gave above is the one who is driving the 73 Plymouth along with
the huge whip and the engine going FOOMP, FOOMP, FOOMP, FOOMP, FOOMP, because it is missing on 3 cylinders and he can't afford to have the plugs changed because he had to have his Connex radio modified to work on CB. He CAN'T catch
anybody with it because his motor is skipping so badly, and it smokes so that the cops
would pull him over for creating a hazard to other motorists! LOL!

For the serious answer, we don't care what you do on the 40 channels, Have at it. Run
'them thar leenyars', it simply isn't any of my beeswax if I stay off there, right? But those
truckers have no business up on 10 meters, the hams WILL fight toothe and

nail to pro-
tect what is rightfully theirs. And if the drivers don't like it, then they
can kiss my a**!

Of course a
> large percentage of hams are boring themselves and cannot make the
> connection..

I would rather talk to an intelligent Amateur anyday than hear "10-4 thar,
mercy me thar,
I heerd that-ah did--, shore thang thar, yore a-walkin' that thar dog,
treetop tall thar,
shore thang mah friend, gre't day, a brangin' smoke offa mah antenner thar,
mercy thar,
git back, break." SQUEAK!!!! BEEP!!!
>
> 4. Most non trucking hams also don't understand that most truckers
wouldn't
> even own a radio if he or she
> wasn't in trucking and don't have a radio in his or her own car.

Fine! Stay in your own back yard. Go onto the ham bands, and, sooner or
later,
there will be hell to pay.
>
> Now of course I run a legal radio set up : Uniden 76 (no tune or peak)
> Monkey made antenna and a small
> X-force 400 amp :)

Legal? Yeah. right. Whatever. Just stay in your own yard.

Disclaimer: Now that I have insulted (some), I want to make it clear that I
am answering
in kind to one who would want to make insults himself. The cross section of
people that
enjoy whatever hobby ranges thruout the American population. For every
negative thing
ONE can say about another group, it can be thrown right back. If I offended
any of the
regulars on this group, that is not what was intended.

It depends on WHERE the bandit is. Fifty watts might interfere, and they
might not.
If there is a big hill between you, you might not even hear him. VHF is
line of sight,
and tends to get blocked by lots of things. In a car, you can be sitting in
one spot and
not hear one single thing. Move 3" and the signal comes in full quieting.

Jerry

Typical thinking: TURN THEM THAR KNOB THINGIES ALL THE WAY RA'HT,
BOYS!!!! Those 80 watts won't even be heard or registered on a receiver's
S-meter.
All you are doing is putting strain on the finals. If they had been meant
to run 150-180
watts, then the mfr would've MADE it that way. Pity that people have never
heard of
"headroom". (sigh)

That's excactly what I thought you would say. The idea that some one would buy one these rigs brand new from copper to use strictly for 10 meter...well I don't think it ever happened. But if it did someone needs thier head examined.

What is so blessed secret about a FET used to provide the input impedence
the mike in stock form needs. The most complicated circuit, where the B+
is not on the mike pin, has these components:
1-JFET equivalent to 2N5484
1-150k to 500k resistor depending on the roll-off desired.
1- 470 resistor
1- 10k pot for level control
1- 0.01 bypass cap *
1 1-mH RFC * which he probably does not use.

Add when separately powered:

1 more RFC*
1- 100 ohm resistor *
1- 470 uf at 16 V *
1- 0.1 bypass *
1- 1k resistor

and some rigs need a 10uf 16V coupling cap or DC blocking cap.

This is filtered and decoupled within an inch of its life and there is no
evidence he has done so. The parts for the taming of the beast are marked
with *.

Rocket science this is not.

Dick N&#65533;BK

Source record: 127261

>The matching loop is all-important on these

Yes, I know. I have all of the parts, just wasn't exactly sure how they were assembled. I had helped install several ringos years ago but my mental picture was sort of foggy. This morning I went browsing in cushcrafts web site and find that the 6 meter ringo is assembled exactly like the old CB one and it's sort of like I remember. Right now (and this is subject to change at any moment), I am planning to use all new nuts and bolts, order a new coax connector and maybe replace the old flat aluminum matching bar with the newer round rod sliding assembly.
I have already cleaned up the vertical and ring and they look as good as new.

Thanks for all the input, RM~
PS, So far I have fifty cents invested. ;-)

Hey mr Phil Covington what happened you been real quiet, hows the poetry
going?
Talk on the CB lately?

1371. Re: Hmmmm.....

In <79fN8.93689$9z5.5544639@typhoon.austin.rr.com>, "Randy"
<rchapman8@houston.rr.com> wrote nothing at all.

Back when I was in high-school I went to a cattle auction in Idaho.
Interesting thing to watch. After they bartered off all of the prize
breeding steer they started auctioning off lots for slaughter. This
continued for a while. Near the end of the auction most of the bidders
were gone, and the only lots left were the most flea-bitten,
lice-infested, malnourished and underdeveloped cattle on the block.
There were just two bidders left that were competing for this refuse:
the glue company and McDonalds. I shit you not!

So - let me get this straight - you are saying that folks in and around Disneyland would operate converted high-power radios on an unlicensed service like MURS.... or FRS???? Funny, I haven't heard of ANYONE (especially YOU!)complaining about FRS users being jammed at Disneyland.

Your true colors are showing, Randy... you just seem to dislike MURS for some reason... what could it be??? Uuummmmm, I don't know... maybe SATAN!!! oops that's the CHURCH LADY.... no it couldn't be SATAN... Ummmmm - I don't know... maybe DATA!!!!

Yes, Randy Hefner - DATA BIGOT EXTRAORDINAIRE.

This is not necessarily true. The Rohn 25G, which is commonly used for
short towers and relatively light wind loads is all the same diameter.

Hrm... While I've agreed with most of what you've posted so far Twistedhed,
I disagree with your interpretation of C-h-u-l-i-t-o's post.
Here it is again:

> can someone explain to me how in the hell do those guys on channel " 6"
> .ever get any serious talking done all they do is speak that ebonics
> shit i mean yes its a free country and ppl can speak how they wanna
> speak but i just dont understand how they get any talking done i think
> they speak like that just to hear themselves talk and to see which
> saounds the best (in their minds anyway) ...and they run so much
> power but its only on that 6 i dont know yeh i may be ignorant to this
> subject but damn i just never understood why they have to get on there
> and speak that way

It appears to me he's wondering aloud how the hell channel 6 even functions
with the amount of 'broadcasting' being done, especially when it's difficult
to understand half of what the people say (the Southern CB lingo he mistook
for 'ebonics').
Was he trying to provoke a reaction from everybody? It doesnï¿½t seem like it
to me... It appeared to me that he was a novice that doesn't know anything
about channel 6, and that he may be a bit challenged in getting his ideas
out without throwing in a few profane words.
After all, the first few times I heard channel 6 coming in on the skip (and
I'm in Northern California) I thought I could maybe talk with some of these
people (of course I'm running barefoot and have a snowball's chance in hell
of ever doing that).
It took me a while to figure out that these guys just go crazy on 6, and
conversation is an afterthought to pure broadcasting power.

Ask yourself this question: If you didn't know anything about channel 6,
what would you think after listening to it?
Perspective, my little grasshoppa, is a wonderful thing. ;)
Cheers.
Pyro.

Hi Brainbuster,

I do in fact have proof of fictional "Aaron's" real identity. It comes from the same source as the proof of QRM2000 aka YRAC's identity (and it is not from a groups.google.com search). And it is unequivocal. As far as using fictional "Aaron's" "too lazy" tactic - I am only having a little fun with fictional "Aaron". The information will come out in good time - but on my time table. Until then I will give you a little hint: Study fictional "Aaron's" posts (I know there is entirely too many of them!). Compare them to some other ACKers posts, especially some that scarcely post here under their real identity. Go back to some of fictional "Aaron's" first posts to this newsgroup. In each of fictional "Aaron's" posts there leaks out a bit of his real personality. There is a identifiable pattern in his messages that gives his real identity away. He cannot help this because it is an unconscious phenomenon. Only they very talented (after years of study and practice) can suppress this leakage and fool even the trained eye. Some never master writing under multiple identities. Fictional "Aaron" hasn't.

I know what it takes to do so and I am unable to master it either.

For good reading see the post with subject "ATTN: Tim, Itsallgood, Others -
Ask and you shall receive!"
Before anyone makes the claim again - fictional "Aaron" is not QRM2000 aka
YRAC aka K5PF :-)

You can buy the same mast at a local Lowes home improvement store for
$59 . My advice would be to special order the Channelmaster 1650
push up mast at Lowes. Same design as the Rat Shack one except instead
of one 18 gauge section and the other sections 20 guage steel, it has
16, 16, 18, 18, 18 gauge sections. Much stronger. And the mast is made
by Rohn, the tower folks. Although rumor has it the Rat shack ones are
also made by Rohn. The 50 footer was $79 at Lowes last time I special
ordered one. If you don't need the full 50 feet, extend each section
about half way and you will have added stregth with the overlaping
sections.

well.....that could be true or not true depending on how close this
mudduck is to a channel 6 talker.......if he is close then the
bleedover is 40 up and 40 down and there aint no doubt about
that.........sdj is down in the dome.....

Probably another "phallic, I gotta get one of those cuz it's bigger"
antenna, made to catch the uninformed. Then again, it could be something
that rewrites the laws of physics. Take your pick.

George, bring it on! I won't bring up your preference for little girls on
bikes if you don't want me to.

At any rate, my sis happens to be a very well connected sheriff's deputy. We
all have skeletons in the closet, some of us get past the little bumps in
life. All the shrinks say pedophiles never never get better. They still
desire kids. But, on the bright side, George, you can still get free
treatment for the desire for children.

George, you were the one that had desires for my daughter when I mentioned we were going bike riding. You really are in need of help. I did caution you though on the perils of messing with MY daughter. I don't have the desire to search for the exchange on Google, but if you'd like to have it here, I can certainly oblige you.

I guess if they are bringing up your own posts about your previous chemical dependency then you are not getting much respect, huh Randy? And all because you can't discover the identity of Aaron Voobner. What a pitiful life you must lead: Trolling newsgroups in a desperate attempt to make name associations where none exist; and when your girlfriend won't talk to you because you took her to McDonalds on her birthday you make your way to Nebouts to get some of those "adult" drinks he stole from his parent's liqour cabinet, and hopefully catch a photo-shoot for his porn site. And don't put too much salt on those fries -- you might have a relapse!

BTW, did you really think that after all those Jenny Craig jokes and drunken tirades in the newsgroup that Voob would grant you some sort of special privilege to his real identity? If you did then you are a bigger putz than Phil, who fell for the scam just like you did. You fell for it because you wanted to believe it -- in fact, it's clear that you made up your mind months ago about our identities despite the facts to the contrary.

Now take your idle threats and shove them up your ass, Randy. And don't email me anymore.

Actually it was pretty funny. You, like so many others, are so
hell-bent on proving Voobner is me, or N8, or Dwight, or anyone else
that you can threaten and harass at home, that you are totally blinded
to the fact that he is just one person posting with a fake name. Your
attempt to discredit him just ended up discrediting yourself, Randy,
because we scammed you just like we scammed Phil. Deal with it. Voob
may have been sincere in his truce, but after your email threats I
don't care. If you want to have a truce with Voob that's up to you.
Deal with him yourself. And regarding your problem with George, like I
said in the email, he is not my responsibility -- deal with him
yourself, too.

Randy,

I think you have figured out by now that I am Frank, and so we can drop the pretense that you are not "Jicon". The reason I am writing is to broker a deal. I have been posting as Voobner and several other personalities for a few years now, partly as entertainment, and partly to provide some reliable legal and technical information as it relates to CB radio. As a person with a technical background you can understand the need to have the right information available to CB'ers in a form that they can understand. I hold you no malice and extend my sincere apologies for treating you so rudely in some of the discussions we had in the past. I hope you understand I was responding in the competitive spirit of the "flame-war" and bore you no personal ill will, regardless of how I came across in print. Now, here is my offer. Let's forget about the past and agree to disagree in the matter of legal vs. illegal discussion on the newsgroup. I will not knowingly respond to your posts and ask that you not respond to mine. Neither will I refer to you in any manner other than cordial. In return you will agree to ignore my other personalities (Voobner, Sparky, Recradiocbpolice, Coaxlengthpolice, JJ, and Auntikeyclown) inasmuch as they may engage others in discussion. I am approaching you as one adult to another, so I ask that you keep this agreement between us and not publish this on the newsgroup.

Sincerely,
Frank
"Aaron"

Randy, you're not answering any of my emails anymore. I wonder why. To bad cuz I need to talk with you and get your advice. Lately I get a weird feeling that Jicon (or some other screeen name with rr.com in the header) is going to suddenly show up again and start attacking Frank/Aaron in the NG and spreading the news that Frank & Aaron are the same person. If that happens I will be so disraught I may have to leave the newsgroup for good.

You pal,

Frank

That's okay, you're not being a party pooper, hehe. It is indeed a CW only portion of the 6 meter band, but beacons are allowed there. In fact, there is a beacon on 50.066 near Bartlesville, OK, in my "neck of the woods". I guess I should have been a bit clearer when I mentioned the AM/SSB C.B. I'll try to somehow modify it to actually transmit in the CW mode, but I need to find more info. on how to do this. If that's not possible, I will find some other option. I don't think it would be 100% legal to just somehow rig up an electronic keyer to inject a tone in the A.M. mode or even the SSB mode. From the way I worded my previous post, it sounded like I was going to use the 50.000-50.100 for actual phone. Sorry about that. This radio will (hopefully) be my workhorse CW beacon, 24/7. I can't quite remember if there is an actual beacon sub-band in the 50.0-50.100 region, but I don't think there is. Ehh, there may be, I don't know. Hope to catch you on 6 SSB sometime...I am in Tulsa, OK, and I need a QSL card from your state.

No, it is not close enough. What you describe does not provide
a directional measurement as an SWR meter does. This is the point
that eludes you.

> >While SWR meters are not complicated, your description is grossly

Bird, Radio Shack and Vanco meters all work this way.
Without the capacitive coupling, the meter reading is not directional;
the SWR meter would not work as you describe.

> > For forward power, the voltage and current

Sparky, what the hell are you talking about? Where do you get this
stuff? How can the forward current not be in phase with the forward
voltage? You are talking nonsense. You are the weakest link.

For a transmission line with a characteristic impedance of 50 ohms,
the forward current equals the forward voltage divided by 50. This is a
fact. Period. End of story. What do you think characteristic
impedance means anyway?

Now an example for the slow thinkers out there:
with a 50 volt forward voltage in a coax of 50 ohms characteristic
impedance, there will 1 amp of forward current. That is, 50/50.

According to Sparky, it would be -1 amps. This claim has no basis
in reality.

> and the phase of the components of the reflected power is shifted from
> that of the forward power according to the reactance of the load. And
> it is the positive or negative phase shift of the current wave along a
> length of the pickup that causes the directional characteristics of
> the induced current in the pickup wire.

Total bullshit. Try to find one authoritative reference that says
anything close to this. I challenge you to explain this in any
semi-meaningful way.

A directional power meter will correctly measure power in a given
direction regardless of the load impedance.

> IOW, if the current at point A on a transmission line reaches it's

> power meter that uses both capacitive and inductive coupling is going
> to get some very skewed readings when phase isn't perfect.

You are wrong. What makes your directional power meter directional?
You cannot determine the direction of the current by a mere inductive
coupling and you cannot determine the direction of the voltage by a
mere capacitive coupling. Try to explain how you can.

> >> So in a nutshell: When the standing wave current is low the SWR meter will

> forward and reflected powers are propagated at the impedance of the
> transmission line, there is no point in reading both the voltage -and-
> current; that is, unless you were interested in the voltage/current
> phase relationship of the resulting signal on the transmission line.

This contradicts your earlier statement. You said "voltage and current
of the forward power are directly opposed." This means it is propogated
at the NEGATIVE impedance of the transmission line.

I explained EXACTLY WHY you need to sample BOTH voltage and current but
this eluded you, too. Unlike the forward signal, the reflected voltage
and current are 180 degrees out of phase. Thus, their contribution to
the reading is canceled out. This is how the reading becomes
directional.

> And that is where you seem to get lost. The forward power will read as
> forward power regardless of reflected power, and vice-versa.

I'm lost!!!??? Hee hee! By the way, this sentence is true.
I never said anything that suggested otherwise.

> That is
> because the voltage (and current) waves are still there but
> superimposed on each other.

Again, true.

> While the o-scope might show a distorted
> waveform, it is still only two sine waves.

Why would it be distorted? Adding two sine waves of the same
frequency yields a sine wave. It may have a different magnitude
or it may have a different phase but it will be a pure, undistorted
sine wave.

> But power meters do not
> read instantaneous voltages or currents,

Wrong! Stop already!

> they read voltages or
> currents averaged over time.

You cannot explain how your theory of operation provides a
directional reading. It can't!

> And since the interaction between forward
> and reflected power, the standing wave, is a function in the time
> domain,

Sparky, you are in over your head here. Standing waves are not
a function of time. Check your reference books for an equation
that shows SWR as a function of time. You're not going to find it.

> standing waves will be read concurrently with whatever
> direction of power the meter is reading. If you happen to be reading

> readings will probably be accurate because of no standing wave
> interference. But if you are reading power on the leading or trailing
> slope of the antinode, then your power measurements are going to be
> skewed up or down accordingly.

Standing waves have no effect on the readings. The forward power
is constant all along the transmission line. The reflected power
is constant all along the transmission line. A measurement of
either of these two powers will not change at any point along
the transmission line. It is a fact. Get over it.

> I hope that cleared things up for you. If I wanted to do a complete EM
> analysis of power meters I would have either done so, told the reader
> to do so himself, or provided instructions on the use of an

Sparky, we have seen the depth of your EM knowledge. It is pretty
shallow.

[rest of Sparky's nonsense snipped]

> conditions, do the experiment yourself (gee, didn't I say that many
> moons ago?)

Yes, and you were wrong then, too. If all the components used truly
have a characteristic impedance of 50 ohms, the readings will not
change. Your simplistic analysis is flawed. You have jumped to
unsubstantiated conclusions.

> >Be sure to use connectors that are 50 ohms impedance for this

> difference in the number of connectors used in the two parts of the
> experiment, any confound caused by connector impedance mismatch is
> eliminated.

Absolutely not true. Sparky, you don't know jack shit.
PL-259/SO-239 connectors have become the defacto standard over

the years but they are not 50 ohms. Did you ever see a vector
network analyzer (basically an impedance measurement device) that
used these connectors? Never.

Saying that it doesn't matter where a connector is placed in
the transmission line is like saying that it doesn't matter
where you put the antenna coil. You must realize that this
doesn't make sense. Move your antenna coil from the base of
your antenna to the back of your radio and see if it makes a
difference.

> >And be sure your coax is truly 50 ohms impedance -- don't rely on
> >what Radio Shack says it is.
>
> No shit!

How have you verified that your transmission line is truly 50 ohms?

[snip]

> When the match is low, the current nodes are
> at 1/4, 3/4, 5/4, etc. wavelengths from the point of mismatch.

This statement requires that antenna impedance have no reactive
component. There is no guarantee that this will be the case

>It is
> at these points where power measurements are the MOST ACCURATE, not
> the most skewed as I previously stated.

Not.

[snip]
> The antenna manufacturers are not recommending 18
> feet to deceive, but to ensure accuracy of SWR measurements.

No they aren't.

> Measuring
> SWR -away- from the nodes will skew the readings.

Nonsense.

> impedance deviation of the standing wave is directly proportional to
> the SWR. This is nothing more than simple math.

This much is true but it doesn't create any problem that will
cause coax radiation.

[snip]
> The coax impedance dictates nothing -- that is the "characteristic"
> impedance of the transmission line; meaning that if the coax impedance
> is 50 ohms, it works properly when the signal is 50 ohms.

All signals in the coax propagate at the characteristic impedance
of the coax. There is nothing you can do to change that.

> It DOESN'T
> mean that you can pump in any impedance you want and it will magically
> transform it to 50 ohms.

Actually, in a sense it does. The characteristic impedance of the coax
dictates the relationship between the voltage and current of the
signals within the coax. Any portion of a signal that does not
conform to the characteristic impedance of the coax is reflected
at the interface.

If you try to feed a 75 ohm signal into a 50 ohm coax, some of the
signal will propagate through the 50 ohm coax as a 50 ohm signal.
The rest of the signal will be reflected at the interface.
In electrical engineering and the study of magnetic fields, they refer
to this situation as boundary conditions. The boundary (interface) has
a specific V/I relationship that MUST be satisfied. Part of the
signal is reflected to satisfy these conditions.

> It is not an "apparent" impedance. It is the real impedance of the
> very real standing wave. Or, more appropriately, it is the real
> impedance deviation along the length of a standing wave. You might
> even call it ZSWR. Hmmm...not a bad idea...

It is an apparent impedance because it is the sum of voltages divided
by the sum of currents; not the V/I for one particular signal but
the V+V/I+I for two signals.

Consider this scenario:
What if you transmitted short pulses such that the forward power
were zero by the time that the reflected pulse arrived? The
V+V/I+I equation becomes 0+V/0+I. What would be the relationship of
the reflected pulse voltage to the reflected pulse current? What
would your impedance be then? Do you not find that, despite not
changing any components in the system, your "real" impedance has

now changed?

To: Sparky
Re: Scam
Date: 6/7/02 4:03 AM EDT

I have emailed [from aaron_h_voobner@yahoo.com] Randy AND Phil each a
copy of this.....lets see how they respond and we can jerk whoever is
the dummy around for a while.

* * *

Randy,

I think you have figured out by now that I am Frank, and so we can
drop the pretense that you are not "Jicon". The reason I am writing is
to broker a deal. I have been posting as Voobner and several other
personalities for a few years now, partly as entertainment, and partly
to provide some reliable legal and technical information as it relates
to CB radio. As a person with a technical background you can
understand the need to have the right information available to CB'ers
in a form that they can understand. I hold you no malice and extend
my sincere apologies for treating you so rudely in some of the
discussions we had in the past. I hope you understand I was responding
in the competitive spirit of the "flame-war" and bore you no personal
ill will, regardless of how I came across in print. Now, here is my
offer. Let's forget about the past and agree to disagree in the matter
of legal vs. illegal discussion on the newsgroup. I will not knowingly
respond to your posts and ask that you not respond to mine. Neither
will I refer to you in any manner other than cordial. In return you
will agree to ignore my other personalities (Voobner, Sparky,
Recradiocbpolice, Coaxlengthpolice, JJ, and Auntikeyclown) inasmuch as
they may engage others in discussion. I am approaching you as one
```

adult to another, so I ask that you keep this agreement between us and not publish this on the newsgroup.

Sincerely,
Frank
"Aaron"

So true. Randy's predisposition to believe that I am multiple people is what made the spoof work so well.

It goes without saying that I have no idea how Sparky feels and cannot speak for him. Nevertheless, many of the feelings I expressed in the spoof letter had a sincere basis. I actually DO think Sparky & Randy should have a truce of some sort. I also think the NG should 'lighten up' with regard to overly obsessive concern with who is who. And NO ONE should threaten ANYBODY with physical harm, even as a joke.

Again, no hard feelings Randy, but it was mostly you that did yourself in.

-Aaron-

More accurate than my generic expression of SWR. Try to read for
content instead of searching for reasons to whine.

>the SWR meter would not work as you describe.

That's a load of BS and you know it! Where did you get your RF education: a TAB book? One has only to look at the schematic to see just how it works, and to see that it works by inductive coupling, not capacitive coupling. In case you didn't notice, the SWR meters that are built into many radios are designed based on inductive coupling, not capacitive. All one needs to do is to look at the SWR meter PC board: it is an extention of the coax cable, nothing more than two traces (the shield) outside of a center trace (the center conductor). The amount of capacitive coupling for the two or three inches of PC board this requires may be all of 5 pFd, not even enough to drive a 1uA meter. And anyone can tear apart their meter to see just how it works. I did it when I was 12: Why haven't you done it yet?

>impedance, there will 1 amp of forward current. That is, 50/50.
>
>According to Sparky, it would be -1 amps. This claim has no basis
>in reality.

An obfuscation based on your ignorance of phase relationships. When current and voltage are in phase, current follows voltage. Just like DC. But on a transmission line, we don't talk DC. The voltage alternates between the p-p voltage, the current alternates between p-p current, and the two are not always in phase. In fact, they are 180 degrees out of phase for a non-reactive transmission line. Quit trying to confuse the facts.

>> and the phase of the components of the reflected power is shifted from

>Total bullshit. Try to find one authoritative reference that says
>anything close to this. I challenge you to explain this in any
>semi-meaningful way.

I'm sorry, CLP, but it appears the concept of electromagnetic
induction is too fundamental for you to understand. This is really
simple: if you have a current going one way in a wire, it will induce
a current going the opposite direction in a parallel wire. It's just
too simple. The problem you seem to be having is the direction of the
original current: and I'm suprised you are having that problem, since
that was the whole basis of your argument several months ago.

>A directional power meter will correctly measure power in a given
>direction regardless of the load impedance.

False. The readings can be distorted by standing waves. The proof
resides in the experiment that you refuse to do.

>> IOW, if the current at point A on a transmission line reaches it's
>> peak before it peaks at point B (caused by forward power, for the sake
>> of argument), the current will flow in a specific direction in the

>> power meter that uses both capacitive and inductive coupling is going
>> to get some very skewed readings when phase isn't perfect.
>
>You are wrong. What makes your directional power meter directional?

The phase differential along the length of the inductive pickup. This
has nothing to do with capacitive coupling (unless capacitive coupling
is the intended mode of operation for the meter). I can't believe you
didn't learn this in first year physics.

> You cannot determine the direction of the current by a mere inductive
>coupling

The hell you can't! It's done all the time!

> and you cannot determine the direction of the voltage by a
>mere capacitive coupling. Try to explain how you can.

I already did. You just didn't pay attention. Inductive or capacitive
coupling, it's an "either - or" situation. Mix the two and you have to

deal with I/E phase, which is not even the issue here.

>> >> So in a nutshell: When the standing wave current is low the SWR meter will
>> >> show less than true reflected power, and when the current is high the
>> >> meter
>> >> will read high.
>> >
>> >This is all wrong because your premise ("works from an inductive pickup
>> >wire") does not accurately describe the true operating mode.
>>
>> The premise IS accurate, as stated above. Additionally, since both the
>> forward and reflected powers are propagated at the impedance of the
>> transmission line, there is no point in reading both the voltage -and-
>> current; that is, unless you were interested in the voltage/current
>> phase relationship of the resulting signal on the transmission line.
>
>This contradicts your earlier statement. You said "voltage and current
>of the forward power are directly opposed." This means it is propogated
>at the NEGATIVE impedance of the transmission line.

It contradicts nothing. The phase relationship of the forward power is
only relevant when the the I/E phase of the reflected power is shifted
by the reactance of the load.

>I explained EXACTLY WHY you need to sample BOTH voltage and current but
>this eluded you, too. Unlike the forward signal, the reflected voltage
>and current are 180 degrees out of phase. Thus, their contribution to
>the reading is canceled out. This is how the reading becomes
>directional.

Since the purpose is to get the lowest SWR possible, a reduction in
VSWR is going to coincide with a reduction in ISWR, and consequently a
reduction in the I/E phase of the reflected power. If, as you insist,
the current and voltage are 180 degrees out of phase for the reflected
power, but in-phase on the forward power -- and if your power meter
requires both voltage and current measurements -- then your whole
system of SWR measurement fails in a puff of phase. Do the math and
you will see your error.

>> And that is where you seem to get lost. The forward power will read as
>> forward power regardless of reflected power, and vice-versa.
>
>I'm lost!!!??? Hee hee! By the way, this sentence is true.
>I never said anything that suggested otherwise.
>
>> That is
>> because the voltage (and current) waves are still there but
>> superimposed on each other.
>
>Again, true.
>
>> While the o-scope might show a distorted

>
>Why would it be distorted? Adding two sine waves of the same
>frequency yields a sine wave. It may have a different magnitude
>or it may have a different phase but it will be a pure, undistorted
>sine wave.

Only when they are in phase or 180 degrees out of phase. Adding two
sine waves of the same frequency but are phased 0 > r > 180 > r > 360
degrees apart does not result in a sine wave.

>> But power meters do not
>> read instantaneous voltages or currents,
>
>Wrong! Stop already!

What? Are you going to say that power meters can read
voltages/currents at 27 million times per second? Yeah, right.

>> they read voltages or
>> currents averaged over time.
>
>You cannot explain how your theory of operation provides a
>directional reading. It can't!

It does as I explained before. Like it or not. It's called inductive
coupling and it's a fact, so deal with it.

>> And since the interaction between forward
>> and reflected power, the standing wave, is a function in the time
>> domain,
>
>Sparky, you are in over your head here. Standing waves are not
>a function of time. Check your reference books for an equation
>that shows SWR as a function of time. You're not going to find it.

I have to hand it to jicon here. He made me verify the source of a
standing wave, any point of which is the sum of the algebraic
displacements of the individual waves. A standing wave is, by
defintion, a fuction of these displacements over time. Go back and
review your 1st year physics.

>> standing waves will be read concurrently with whatever
>> direction of power the meter is reading. If you happen to be reading

>
>Standing waves have no effect on the readings. The forward power
>is constant all along the transmission line.

True. But any standing wave is also constant along the transmission
line. The voltage and/or current from a standing wave can be read just
as easily as the voltage and/or current from forward or reflected
power. This will confound the measurements for obvious reasons.

> The reflected power
>is constant all along the transmission line.

Again true, and with the same constraints.

> A measurement of
>either of these two powers will not change at any point along
>the transmission line. It is a fact. Get over it.

It is not a fact, and you wouldn't say that it was if you had done the
experiment.

>> moons ago?)
>
>Yes, and you were wrong then, too. If all the components used truly
>have a characteristic impedance of 50 ohms, the readings will not
>change.

Not all the components have an impedance of 50 ohms. The standing wave
deviates from the characteristic impedance of the transmission line
proportional to its magnitude.

> Your simplistic analysis is flawed. You have jumped to
>unsubstantiated conclusions.

Your previous argument was "simplistic", yet it was flawed. And your conclusions are totally unsubstantiated. My arguments, however, are supported by the references I have cited in the page. I also have a couple more references to add to that page (after editing for mistakes, of course).

BTW, did you ever to find a copy of that book I referenced? I remember you xeroxed a couple pages but were unable to quote the first few words from a very important page. If you have the book (like you said you did) do you think you could complete that quotation now?

>> >Be sure to use connectors that are 50 ohms impedance for this
>> >experiment. PL-259 connectors are not 50 ohms.
>>

>
>Absolutely not true. Sparky, you don't know jack shit.
>PL-259/SO-239 connectors have become the defacto standard over
>the years but they are not 50 ohms. Did you ever see a vector
>network analyzer (basically an impedance measurement device) that
>used these connectors? Never.

I didn't say that they weren't 50 ohms, I said that the influence they have over SWR is negligible, which is true. This is because the brief impedance variation they cause is not significant enough to even register on a power meter, even on a Bird. That is true, and you can't prove otherwise because UHF connectors are used everyday in systems that achieve a 1:1 SWR. Kinda blows your connector theory out of the water. In fact it blows your whole excuse for not performing the experiment.

>Saying that it doesn't matter where a connector is placed in
>the transmission line is like saying that it doesn't matter
>where you put the antenna coil.

Oh please! Are you now going to say that to throw a pebble is the same as moving a mountain?

> You must realize that this
>doesn't make sense. Move your antenna coil from the base of
>your antenna to the back of your radio and see if it makes a
>difference.

If the same confound is used in both the experimental group and the control group, the confound is negated as a cause and is therefore irrelevant. Or did you sleep through statistics?

>> >And be sure your coax is truly 50 ohms impedance -- don't rely on
>> >what Radio Shack says it is.
>>
>> No shit!
>
>How have you verified that your transmission line is truly 50 ohms?

Don't get anal with that comment: I was addressing the fact that RS
isn't the best place to get coax. I agreed with you. Or do you
disagree with your own comment just because I agree with it?

>[snip]
>
>> When the match is low, the current nodes are
>> at 1/4, 3/4, 5/4, etc. wavelengths from the point of mismatch.
>
>This statement requires that antenna impedance have no reactive
>component. There is no guarantee that this will be the case

Wrong. My statement is consistant regardless of load reactance. Any
reactance of the load will influence the current/voltage phase shift
of the reflected power, but will not change the nature of the mismatch
(forward power impedance being low or high compared to the load
impedance).

>>It is
>> at these points where power measurements are the MOST ACCURATE, not
>> the most skewed as I previously stated.
>
>Not.

Now THERE'S a persuasive argument -- "Not".

You are ignoring the obvious: the lack of current from the standing
wave at the node of the standing wave (a consequent of the time-domain
which you deny) will not cause any interference on the power meter's
inductive pickup (the function of which you deny). The funny part is
that your denial is in partial contradiction to your claim that SWR
can be read accurately at any point along the transmission line.

>[snip]
>> The antenna manufacturers are not recommending 18
>> feet to deceive, but to ensure accuracy of SWR measurements.
>
>No they aren't.

Another persuasive argument -- "No they aren't". Care to elaborate why
antenna manufacturers recommend 18 feet of coax? Oh, that's right, you
can't. I forgot that you don't have an explanation for that, even
though you have an explanation for why everything I say is wrong.
That's ok, CLP, I understand -- after all I have had experience with
other obsessed individuals like twistedhed, Phil, and Randy. I
understand that the next "I hate Sparky" support group is open for new
members -- maybe you should apply.

>> Measuring
>> SWR -away- from the nodes will skew the readings.
>
>Nonsense.

Nonsense = no sense = no explanation. So what explanation do you have
for your comment "Nonsense"? If the current is changing how can it
-not- affect an inductive pickup? Or if the voltage is changing how
can it -not- pass through a capacitive coupling? Your comment is
nonsense.

>> >> How Can A Coax Radiate?

>This much is true but it doesn't create any problem that will
>cause coax radiation.

Did you miss something really fundamental here? If the characteristic
impedance of a transmission line is the signal impedance where the
transmission line works to contain the signal, doesn't it stand to
reason that if the signal is not that of the characteristic impedance
then the transmission line will not contain the signal? After all, how
does a transmission line work? Isn't it a distributed balance of
inductive and capacitive reactance? What happens when you detune a
tank? Doesn't one component dissipate excessive power? Where do you
think that power goes? Does it all get converted to heat? Of course
not. Some of it is radiated as RF power. Stop being so ignorant.

>[snip]
>> The coax impedance dictates nothing -- that is the "characteristic"
>> impedance of the transmission line; meaning that if the coax impedance
>> is 50 ohms, it works properly when the signal is 50 ohms.
>
>All signals in the coax propagate at the characteristic impedance
>of the coax. There is nothing you can do to change that.

NO! All signals DO NOT propogate at the characteristic impedance of
the coax. You can run DC through your coax, but does the impedance of
that DC need to be 50 ohms? Of course not!

A transmission line will dissipate (to some extent) any component in
excess of it's characteristic impedance. IOW, if you feed a 50 ohm
coax with 100 volts @ 1 amp, the coax will try to dissipate 50 volts
in order to reach that 50 ohm impedance. Part of that dissipation is
by reflection; but since you can't dissipate pure voltage, the coax
must remove the excess voltage according to impedances at it's
disposal: i.e, via the impedances of the shield. Why the shield?
Because it cannot dissipate power from the working portion of the
transmission line.

That's a simple description of a simple effect that can be measured
with simple test equipment. Try it.

>> It DOESN'T
>> mean that you can pump in any impedance you want and it will magically
>> transform it to 50 ohms.
>
>Actually, in a sense it does. The characteristic impedance of the coax
>dictates the relationship between the voltage and current of the
>signals within the coax. Any portion of a signal that does not
>conform to the characteristic impedance of the coax is reflected
>at the interface.

Some of it is reflected, and the rest is either conducted to the load
or dissipated (radiated as RF or heat). Nothing is transformed.

>If you try to feed a 75 ohm signal into a 50 ohm coax, some of the
>signal will propagate through the 50 ohm coax as a 50 ohm signal.
>The rest of the signal will be reflected at the interface.

Only part of the signal will be reflected. Once again, the impedance
of a transmission line is a "characteristic" impedance, not a load
impedance. Look up the difference in your Rat Shack dictionary.

>In electrical engineering and the study of magnetic fields, they refer
>to this situation as boundary conditions. The boundary (interface) has
>a specific V/I relationship that MUST be satisfied. Part of the
>signal is reflected to satisfy these conditions.

A transmission line is not a load, therefore is not a boundry.

>> It is not an "apparent" impedance. It is the real impedance of the
>> very real standing wave. Or, more appropriately, it is the real
>> impedance deviation along the length of a standing wave. You might
>> even call it ZSWR. Hmmm...not a bad idea...
>
>It is an apparent impedance because it is the sum of voltages divided
>by the sum of currents; not the V/I for one particular signal but
>the V+V/I+I for two signals.

You are totally ignoring phase, which is the fundamental building block of a standing wave.

>Consider this scenario:
>What if you transmitted short pulses such that the forward power
>were zero by the time that the reflected pulse arrived?

Ain't gonna happen.

> The
>V+V/I+I equation becomes 0+V/0+I. What would be the relationship of
>the reflected pulse voltage to the reflected pulse current? What
>would your impedance be then? Do you not find that, despite not
>changing any components in the system, your "real" impedance has
>now changed?

The voltages and currents add according to the phase between forward and reflected power. The two (voltage and current) are independant where standing waves are concerned (a voltage standing wave is related to the phase of forward voltage to reflected voltage; the current standing wave ...yada...yada...yada...). If your load is a total short your voltage will be maxed but your current will be nil. And if your load is totally open the opposite is true. But these cases are only possible hypothetically, not in reality. And characteristic impedance is only pure in hypothetical situations as well. In reality, a load mismatch will result in dissipation from the coax either in the form of heat or RF radiation, but usually as both. The rest is propogated back to the source; but how much bounces back depends on the propogation efficiency (containment) of the signal within the coax. This figure is never 100%. And even some keyclowns will tell you that dissipation (mismatch) under high power RF can be enough to melt insulation.

But don't take my word for it: test it for yourself. Or haven't you done so already? Of course you haven't, you have been busy here presenting opposition to the experiment without any fact or reason. Do the experiment. Actually, I encourage anyone remotely interested in this discussion to do the experiment. See it for yourselves. Then come back here with your explanations and/or excuses.

To get CW from an AM radio - throw away the microphone and key the
radio as needed.

> possible, I will find some other option. I don't think it would be 100%
> legal to just somehow rig up an electronic keyer to inject a tone in the

There is a CW mode that uses a tone injected into an AM signal. I forget
what it is called.

Injecting a tone into a SSB rig should be indistinguishable from keying
an AM carrier.

It helps to ground the audio line because some of them chirp if left
floating.

A2 telegraphy -- amplitude-modulated tone.

>Injecting a tone into a SSB rig should be indistinguishable from keying
>an AM carrier.

Same difference.

Been a lot of years since I was on the Magic Band and I have exactly zero equipment. I also have Channel 3 looking down my throat.

Actually doing cw thru an SSB transmitter is the preferred method these days and has been done that way since Collins did it. The W1AW cw, fsk, digital sigs are currently done that way. A single tone cannot be distinguished from a steady carrier to a receiver; a true 'black box' problem.

Beacons are not my cup of tea. I can see some sense in them on six but I do have to question whether the world, given that there is one in Bartlesville, really needs one in Tulsa.

Converting a CB rig is not going to be easy. First off the PLL counts in 10s and that is a bit tough to change. A sideband rig uses a mixer which may be changed with a crystal but every tuned circuit thereafter will need changing. Not sure how I would go at it.

Have fun with six but don't let it interfere with your code practice.
WARC-03 is currently homeless with Venezuela backing out of hosting it.
We may have a code requirement for a very long time.

Get off my dick and I do not own a surburban.
Find someone else to suck.
Just answer the question. Why is there this strong desire to respond
to my every post? You can think I am whoever you want but why the need
to respond to everything I post? One can only presume you want to suck
my cock. If so I dont do faggots but, I can get a cock in your mouth
in no time just respond back and let me know ok? You in Philly right?

Not only has Frank proven himself technically incompetent with his "measure
SWR with a DC voltmeter" theory, he has also further proven that he has no
credibility whatsoever in anything he writes. He obviously is a lonely

shut-in.

>
> Why does a car go 120 mph+ when the speed limit is only 55/65?
> Why don't car makers make the cars to only go a little over this speed?

Invalid analogy. A better one would be a car is rated to go 100 MPH all
day long. But it is capable of going 150 MPH. But at 150 MPH, you run
the risk of blowing tires, smoking the engine, or any number of outher
drivetrain failures.

>
> >
> > Could it be that running it at 180 watts can:
>
> > Severely shorten the life of the transmit finals?
>
> Doubtful

Doubtful? And what technical reference material can you cite to back up
that claim? The factory designs a circuit to have a adequate service
life, within the design limits of the devices. If you increase the
stress to any of those components, the first thing that happens is that
the MTBF goes out the window.

>
> > Result in increased spurious emissions or IMD products?
>
> Probable

Very probable. It only takes one reason to not turn up the power, so why
not this one?

>
> > Create more heat than the heatsink can handle, exposing the rest of the
> > rig to high temperatures and possible failures?
>
> Doubtful, and only slightly possible.

And I suppose you've got the thermal rise numbers to bear this out?

> > Exceeding the current draw ratings which could cause PC traces to burn?
>
> Doubtful

Maybe, maybe not. 180 watts is almost double what the factory setting of
100 watts is. That translates to an 80% increase in current. How much
extra current handling is built into the power circuits? I don't know,
neither do you. But it's certainly a possibility.

>
> > Exceeding the RF power rating for the relays, PIN diodes and other band
> > matching components?
>
> Doubtful

Really? You don't know Icom very well do you? I've already fixed radios
for guys (mostly 706's)that have popped out PIN diodes. Most of those
occur due to bad SWR reflected power problems. But it doesn't take a
huge stretch of the immagination to surmise that if the parts are so
close to their design limits, that they can be popped by simple SWR
problems, that upping the power by 80% MIGHT cause the same thing.

>
> > Just because it can doesn't mean it should.
>
> Just be cause it can doesnt mean it shouldn't

I tend to believe that the factory is the best judge of that.

> > I always laugh at screwdriver technicians circumventing good engineering
> > practice......
>
> Hmm that was right from a hams web site who performed the inital mods

Not all hams are all that bright, or morally consciencious. Many
nowadays don't even know a good electrical engineer, let alone act like
one.

I thought I'd share this with the newsgroup. Lately, I've been falling asleep with the rig on. Well, over the past few days some very strong stations have been booming in from places like Michigan, Iowa, and California. All seems normal, right? These guys are booming in during the middle of the night though, around 1:30am. Very interesting. :-)

its called a wide open band and i love it :-) some of the wierdest dx would come in late like that and usually be really strong signals with almost no noise level due to the fact it was so late and the band wasnt crowded at all. seems like my first cycle on the air at times the band was open 24/7. now that was nice....

last night with the cold front moving in I experianced some tropo, I am running an Azden PCS-6000H and I was able to bring up a repeater in the NE corner of ohio on low power and a mobile antenna. I can't wait to get my new tower up, and put my new super j-pole on top of it. Then I will put up a set of stacked yagis. I am also making a folded dipole to run from roof of the new house to the garage.

>Hrm... While I've agreed with most of what you've posted so far Twistedhed, I disagree with your interpretation of C-h-u-l-i-t-o's post. Here it is again:

(can someone explain to me how in the hell do those guys on channel " 6" ever get any serious talking done all they do is speak that ebonics shit i mean yes its a free country and ppl can speak how they wanna speak but i just dont understand how they get any talking done i think they speak like that just to hear themselves talk and to see which saounds the best (in their minds anyway) ...and they run so much power but its only on that 6 i dont know yeh i may be ignorant to this subject but damn i just never understood why they have to get on there and speak that way

>It appears to me he's wondering aloud how the hell channel 6 even functions with the amount of 'broadcasting' being done, especially when it's difficult to understand half of what the people say (the Southern CB lingo he mistook for 'ebonics'). <<

Or the cajun dialects....granted, it's not an impossibility. But "`i think they speak like that just to hear themselves talk and to see which saounds the best (in their minds anyway)" .....doesn´t quite come across as an innocent and benign solicitation for information, but rather a biased opinion to that of which we are all certainly entitled.

>Was he trying to provoke a reaction from everybody It doesn¹t seem like it to me... <<

Me neither, just the bowl crowd.

>It appeared to me that he was a novice that doesn't know anything about channel 6, and that he may be a bit challenged in getting his ideas out without throwing in a few profane words. <<

>After all, the first few times I heard channel 6 coming in on the skip (and I'm in Northern California) I thought I could maybe talk with some of these people (of course I'm running barefoot and have a snowball's chance in hell of ever doing that).<<

You near the coast? Park on the cliff above the Pacific. Odds are definitely against ya', (which makes it just as rare as some tough-to-get skip stations) but it has been done.

>It took me a while to figure out that these guys just go crazy on 6, <<

Shoot, when I was just a little snot I remember checking out the big stations there, . I just knew they were big guns.

>and conversation is an afterthought to pure broadcasting power.<<

Yea, that much is pretty apparent to even the novice listener. There ain't much more to it and that. Folks make it complicated when it's pretty simple.

>Ask yourself this question: If you didn't know anything about channel 6, what would you think after listening to it?<<

If I wanted to talk with this group of regulars on this channel, it's obvious I had better get some serious gear is exactly what I would be thinking. What I wouldn't be doing is bitching about it. Hey, I can't understand why someone would become a no-code and stop there, but I don;t bitch about it unless my opinion is solicited or the topic directs it, as it doesn't concern me.

>Perspective, my little grasshoppa, is a wonderful thing. ;) Cheers. Pyro. <<

Agreed, it is. Maybe a little thicker skin is needed concerning profanity, but it has always been a direct relation to ignorance, especially repeated profanity. Using the "F' word or using a vulgar term to express one's self is one thing, directing it repeatedly at a target for no other reason than one expressing a different view is contemptible.
Nevertheless, your observation is duly noted and, I hope correct. Take it EZ!

Nick the Dragon Slayer was an official in King Arthur's court. He had a long-standing obsession to nuzzle the beautiful Queen's voluptuous breasts, but he knew the penalty for this would be death.
One day he revealed his secret desire to his colleague, Horatio the Physician, who was the King's chief doctor. Horatio the Physician exclaimed that he could arrange for Nick the Dragon Slayer to satisfy his desire, but it would cost him 1,000 gold coins to arrange it.
Without pause, Nick the Dragon Slayer readily agreed to the scheme.

The next day, Horatio the Physician made a batch of itching powder and poured a little bit into the Queen's brassiere while she bathed. Soon after she dressed, the itching commenced and grew intense.

Upon being summoned to the Royal Chambers to address this incident, Horatio the Physician informed the King and Queen that only a special saliva, if applied for four hours, would cure this type of itch, and that tests had shown that only the saliva of Nick the Dragon Slayer would work as the antidote to cure the itch.

The King quickly summoned Nick the Dragon Slayer. Horatio the Physician then slipped Nick the Dragon Slayer the antidote for the itching powder, which he quickly put it into his mouth, and for the next four hours, Nick worked passionately on the Queen's voluptuous and magnificent breasts. The Queen's itching was eventually relieved, and Nick the Dragon Slayer left satisfied and touted as a hero.

Upon returning to his chamber, Nick the Dragon Slayer found Horatio the Physician demanding his payment of 1,000 gold coins. With his obsession now satisfied, Nick the Dragon Slayer could have cared less, and knowing that Horatio the Physician could never report this matter to the King shooed him away with no payment made.

The next day, Horatio the Physician slipped a massive dose of the same itching powder into the King's loincloth. The King quickly summoned Nick the Dragon Slayer...

So let's see,
I posted links to pictures of me fishing on the Sea
of Cortez, in Baja Mexico.

http://www.bajasmokedfish.com.mx/02may14.JPG

You responded with links to some sort of sex sites
I guess, not I, you posted those links.

http://groups.google.com/groups?hl=en&lr=&selm=05jJ8.64077%24Kp.6530789%40bi
n7.nnrp.aus1.giganews.com

You are the one obsessed with sexual innuendos,
I posted a link to the hotel we were staying at,
where we were fishing, had the picture of me and
the fish I caught. You respond with sexual innuendos
as usual, so you are the one infatuated with that
crap not I.
By the way, that Dorado weighed in at 86lbs
and took 23 minutes to land on 30lbs tess line with
a Penn open face reel.

--
If you are implying that people, who
hold ham licenses, should be somehow
held to a higher moral standard than
the "common man", then that would
be faulty logic. A ham license is only
a "permit" to use radio, it is not a
"badge of morality".

Hi Aaron,

That was a very good spot... although, some of thier terms were incorrect, They're not shortwave frequencies. and field day is not about how many contacts you can make... at least it's not supposed to be, it's a Emergency Prepardness Excercise. I will be operating Class 1D Which is 1 Operator, Commerical Power. I will be mostly operating CW. Two years ago, I was first place in Michigan for class 1D, (check your old QST's if you don't believe me) Last year I came in second, and I wasn't even trying... LOL... This year, I am not looking to be number one or anything, just wanna operate CW...

Take care and Thanks for sharing a great article...

>Dx'ing on 11 meters... you're a disgrace to Amateur Radio.
>

Disregarding the melodramatic sentiment of this accusation, I will say that I did not find, in any of Bert's post, any indication that he was transmitting. He never mentioned any QSO with any of the parties listed. I've not seen it written in any law, real or imagined, that it's against the amateur 'code' to listen to long-distance signals, regardless of frequency.
But even if he HAD been transmitting, there is no indication of which frequencies he used. Assuming the best about a fella who's otherwise been a knowledgeable and lively contributor to this group, I'd say the only 'rules of conduct' or actual FCC rules he's broken, IF he was transmitting, is the banal, obsolete and utterly unenforceable law about communications on the CB band beyond 155 miles.
Since Amateur radio has NOTHING WHATSOEVER to do with enforcement, legislation or conduct of the CB band, I fail to see where Bert's posting of hearing DX late at night has ANY bearing on his value to the Amateur community.
Rather, he's offering information, and espressing good-natured enthusiasm, about radio communications in general. This seems to be far more in keeping with the spirit of ALL amateur radio, licensed services or otherwise.
In contrast, your uninformed accusation and derision are far more disgraceful to the radio hobby than anything Bert has written here.
Lighten up.
Linus

Oh you sure are Landballs, Ill admit Randy deserves the attention he gets he can surely dish it out, Mopar same thing he deserves everything he gets he earns every minute of it, twitsy deserves anything anyone says he is brain dead, Jicon is another deserving of attention harasses the Ng under assumed names and when he is caught(philC) now you wanna suck his dick , I don't even talk to bert, I very rarely talk to tim perhaps an occasional message to him, Scott, he is really harmless he is not a keyclown he just seems like he wants to fit in with a "cool" group. If i repost some of the clowns you have named they and your self are not saints to any NG. Why don't you quit your crying you friggin Sissified Cross dresser. I mean get over it, you are beggin again and you want me to focus my attention on you
Well Ill tell you what ...I am going to start making appointments there are 7 days in the week I want the top 7 keyclowns to let me know which day they want my attention, I will focus my attention on you this day don't expect any replies until it is your day. here is the days I am looking at get back to me if you want to switch days with someone. Of course Sunday will be an equal opportunity day

Monday- Landshark
Tuesday- Randy
Wednesday- PhilC
Thursday- Twisty
Friday- Moparholic
Saturday- IceCold/Chimbubba
Sunday-

Good grief, Tim. I've worked Europe and Australia from my HT through a repeater. All rf path. No internet linking. FM and noise free. Heck, an HT provides me a pretty good range of around 100 miles from my living room, 24/7. My former neighbor hears me when I'm on the HT - and she is only about 7 miles from the Pennsylvania boarder whilst I'm up by Lake Ontario. What is your continuous 24/7 range? No doubt you need more than 6 double a alkaline batteries. BTW, at least one repeater is not attached to power lines around here. A windmill and batteries keep it powered (solar power around Rochester, NY, is not a likely method with far more cloudy days than sun - as well as being fairly well North).

73 from Rochester, NY
Jim

ps - pay attention, there is interesting info to be had concerning sporadic e. This affects 27 MHz more than you might believe. Tropo may well be of interest with MURS. There is much better to be done than a couple of the hams and cbers trying to flame each other.

Tim, while I can understand your dislike of the no codes, your little joke about the HT is interesting. I've got NiMH batteries for my camera and NiCads for the HT. I don't use either. You always have to examine how something is to be used before making a choice. For instance, which is better, a yagi or a big vertical? You have to ask the question 'for what?'. In my case, I am an infrequent user of both the camera and HT. Both the NiCads and NiMH batteries exhibit a self-discharge over time. NiMH batteries also do not last as long as NiCads. For high discharge rates, it is hard to beat the NiCads, but, I've often charged my batteries and then, a month later, found they didn't have too much life left before needing another charge. Alkalines fit the bill for me. I can leave the things alone for a month and there is no appreciable loss of life from them. Although I carry extras (especially when I have no idea how much the batteries in the gear have already been discharged), I haven't replaced batteries in either the camera or HT for months. Yes, I can get more power out of the HT with alkalines due to having 1.5 volts each rather than 1.2 volts, but I run on low power. That is sufficient for my needs - including talking to Austalia.

73 from Rochester, NY

I am assuming it is the difference between using the DC ouptut or AC output of your alternator(s) to power your amps?

I notice Leese Neville alts have AC outputs.

Also, for a keydown, does everyone key at the same time, and the station that gets picked up the best by the receiving radio win?

Hello Dick:

That would be neat-Oh to run into a few of the older World Radio Rigs,
They really where neat loking radios.

I believe Dave at:

http://www.Retrocom.com/

has a section on the World Radio Rigs, or at leats photos of them. I
have some old advertisments on them. Neat looking radios.

Very cool, indeed. I did hear one fellow asking others to "QSY up one." (And it warmed my heart to hear an op go "QSX" while he attended to a personal matter.) Had I the strength or inclination to drag my bones from the bed, would I have worked one or two? WFWL. 0;-)

>Good grief, Tim. I've worked Europe and Australia from my HT through a repeater. All rf path. No internet linking. FM and noise free. Heck, an HT provides me a pretty good range of around 100 miles from my living room, 24/7. My former neighbor hears me when I'm on the HT - and she is only about 7 miles from the Pennsylvania boarder whilst I'm up by Lake Ontario. What is your continuous 24/7 range? No doubt you need more than 6 double a alkaline batteries. BTW, at least one repeater is not attached to power lines around here. A windmill and batteries keep it powered (solar power around Rochester, NY, is not a likely method with far more cloudy days than sun - as well as being fairly well North).
73 from Rochester, NY
Jim
ps - pay attention, there is interesting info to be had concerning sporadic e. This affects 27 MHz more than you might believe. Tropo may well be of interest with MURS. There is much better to be done than a couple of the hams and cbers trying to flame each other.<<

Hiya Jim! No doubt, some exciting stuff for you. I can definitely understand the allure that calls you for such activity, however, I must add that many freebanders do not consider repeater activity a thrill. Make no mistake, one way is no better than the other, just a personal preference.

It's getting so it's not very safe to eat at Mickey D's anymore it appears... We just had an article in our local newspaper that said the cucumbers that are used in the pickles used at Mickey D's (and a few other fast food restaurants) are grown in Washington State, where it has been discovered that tons of toxic-waste laced fertilizers have been spread. (which is entirely legal). I think I'm sticking to Subway from now on. :)

Electronically they were pretty blood-and-guts straight-forward designs using the finest 6AQ5s etc that could be bought from Midnight Auto Supply but they did the job and did have a fairly neat paint job and design. One thing you note about old electronics is that the engineers ran the place and most rigs looked homebrew out of the carton. The Italians and Japanese are far better at making things look the price.

I also enjoyed the Predicta which is a repro of the 1956 Philco G-Line 'Cool Chassis' sets some of which would be bizzare today let alone for Ozzie and Harriet. Their fall from grace was caused by a pix tube with a 2.5 volt filament that just did not do it. Remember Fiddleco built the first all-transistor compooter and became Ford Aerospace only to die when a radar designed to protect the base-section commandos and use up great shitpots of surplus M-48 tank chassis misstook another fan for a helicopter and shot the daylites out of a porta-potty in front of a great collection of brass and Congresscum. The fact that the potty was unoccupied did nothing for the project. Not a bad achievement for the Philadelphia Storage Battery Company.

Various Predictas, a sub-line of the Gs, did things like have a chassis that would sit on an end table with the pix tube across the living room and 19kv running under Madame Housewife's carpet not to mention signal and other assorted power leads. But the 'piece de la resistance' was the famous Watercooler that you see pictured, more or less. When the pix tube died, it was not uncommon to install an air pump and keep tropical fish. Can't say it looked its price but it was the end of the TV as Furniture theory. Incidentally, Magnavox was a bankruptcy sale company that included an agglomeration of early companies in the Indianapolis area (the

Incomparable Capehart, the Fabulous Farnsworth, Spartan, Sparton, Meck, etc.) that were basically there because of proximity to NW Indiana cheap wooden cabinets, much like today's RV industry.

I remember going with my dad to a meeting of warranty techs to introduce this line which really was a quantum leap from the previous split-chassis designs. The company man went into great gobs of glee about how the ventilation system was designed to keep the set cool and such innovations as 5/16 holes under the tubes in the PC board would cool them hence the Cool Chassis name. They also prevent the board from breaking from thermal shock. A guy named Orville from Nebraska City (a K&#65533; known to us) set the keynote for the after-meeting by observing that after all these years the engineers had finally discovered that 'heat goes up'.

I get by 3914 West Broadway in Council Bluffs IA now and again and it is with some emotion that I note the building is now the HQ for the Salvation Army. I lost track but WRL became Galaxy with some tie to Hy-Gain which was in Lincoln NE at the time and the whole thing went into the cesspool. The owner, Leo Myerson W&#65533;GFQ, is still alive in his 90s.

And for the encore, we will sing three choruses of 'Long Ago and Far Away'.

Dick N&#65533;BK

I dont know about you DXers out there but I am getting real tired of these hams coming in here and giving us shit about running to many channels or to much power or holding the mic. wrong or whatever! Personally, I dont have much use for 10 meter. A bunch of guys that have nothing better to do than come here and harass the "CB" guys. If 10 meter is so cool, why are the hams always in here giving us grief and not on the radio?

I can't totally disagee with you and I are one and have been longer than CB has existed. There is no basic conflict between the services so long as it is kept above 25 and below 28. As a practical matter, one who is radioactive enough to have obtained an Amateur ticket more than likely did some time around 27. A parallel thread has Bert, WA2SI, getting some crap about listening on CB which gives me the urge to apply my 45 years of licensed experience to wringing a few necks. He is a new Extra, I am an old one, BFD. But there are those who for some reason desire a separation and warfare mostly for ego-boo purposes.

But with a few exceptions, most of the legal eagles here either never have listed or specifically deny holding an Amateur ticket or, like George, are simply insane. And most of us OTs (Old Timer) that wander in and out are really pretty cuddly grandfather-types. We may tell you what you really don't want to hear but we tend to be fairly nice about it. If you have been around here any length of time you know my views on Ancient Modulation in general and swingy audio in particular. My theory is that ignorance is curable, stupidity is a lifetime affliction, and mythology is simply expensive. Soft-pedaling the truth is for kindergarten teachers; adults deserve it undiluted.

One thing you may see and this is to some extent more an Amateur problem than a CB one is the ongoing battle about the role of Morse Code in Amateur testing. The treaties literally define an Amateur as knowing the code; ending this has been deferred from two previous treaty meetings and there is some question when, where, or if the meeting scheduled for 2003 will come off and a pretty fair chance of deferral again for 10 years or

so. But it does mean that the codeless Techs are Amateurs to the FCC but not the International Telecommunications Union. Running below 30 MHz where the ITU holds sway does require a code test at a wonderous 5 wpm in the US.

This actually puts a lot of OTs in an interesting ethical position; we are the guys who have to tell a lot of Techs that they have been sold a bridge really cheap. The history is that they get buried on Phone and never advance so we really do have to deliver both the bad news and a bit of encouragement to get over the code test and move on. This does not produce a lot of instant goodwill and after a year or so we pretty much have to write them off as losses and a lot of bitterness results on both sides. So you get them down here playing status games because they have no status in the Amateur ranks. There are some that get their shorts in a knot over the code test so they find something else to do like 'clean up' CB. As I take a fairly relaxed approach to radio, I will encounter radio cops on repeaters now and again but holding a 1x2 callsign that has not been available in years tends to give one an aura of invincibility and a few dirty tricks to send them back under the bridge. It's easier on a repeater than here.

But there is one great difference between the services that I am coming to appreciate more and more. Being a legal and licensed service I have access to some really good pubs and after a while develop a network of resident geniuses on virtually any subject I care to explore and more than likely the lend of some gear to get on. So you do not have nearly the mythology on 28 or 24.9 which I like better that you have on 27 where some theories of AM were obsolete before I was born or for that matter before my dad was old enough to drink. I will agree, however, that it works better when the resident geniuses both really are and wait to be asked.

And the reality is that those more gung-ho tend to move out of CB leaving you a depleted pool to pick from. Once going the Amateur route, there is a tendency to demand a bit more committment before stepping in to help. Kind of the Tech thing again.

Do your thing and pay little attention to those who played 35 questions for the FCC.

For those interested, the usual three websites:

http://www.arrl.org for most of the basic poop.
http://www.qrz.com for good sample exams
http://ah0a.org for Morse Academy, a proven computer-based method. The ARRL CDs are also good.

Richard,
Very well put, but I would add that there is a problem with being the ot extra on the block--everyone interested in advancing, or pretending that they want to advance, catch you at the most inopportune times to seek your skills as an Elmer. I gave a code practice cd to a tech about a year ago and learned today that he is thinking about beginning to learn the code. Trigger took less time and could stomp it out with his hoof at 15 wpm before his untimely death. Another guy bought a mobile 10 meter radio but has honestly never keyed it becasue of his lack of code knowledge. He'd hoped it would inspire him. Folks--take a hint. Never buy a radio thinking it will inspire you to learn the code or increase your speed. Neither is likely to happen in your lifetime......and the ultimate is learning cw Q signals and using as many as you can in a sentence on the local repeater. "I'm with the XYL and headed to the qth so I can qsy to 20 to operate my qrp rig qrs if there is no qrn. Qsl, OM?" Time for me to go qrt.

Steve It was a tough decision with you and Randy on Friday,
seeing how it is a party nite i went with you and gave Randy a
chance to relax and catch a good buzz, if he so desires.

Try going a week without a single reference to gayness or parts of a
male anatomy. -St. Twist

St.Twist thanks for the reply OM, but I have done this I went on a truce
with landshark ,
yes I know You can't believe it but yes I did and he couldnt stand the fact
that he was no longer the main attention getter.

Yet no matter he accuses me of being aaron so who ever aaron talks to or
about he thinks it is me...

Sucks being that paranoid though doesn't it.

Very interesting outlook Dick. I may have been misleading? on the original post. I dont mind the hams coming here. I just dont see why they have to start shit. Hell I listen to 10 meter but dont key on it. I dont mind them coming on our local channel and talking. One of my best "radio buddies" is a ham but he is respectful of the DXers. I dont think I am asking to much when I ask the hams to not start crap when they are in this NG. As far as the CW thing goes, I have been able to not only recieve but recieve and send right around 20WPM since I was 15 or 16. I was in a "keying club" when in Jr. high. I can understand why some of the OT's are upset about the 5WPM recieve portion of the FCC licensing test. I dont know if you would concider me an OT or not but I still have the ticket from Citizens Band. I wish that the FCC would bring that back(just longing for the old days I guess) ok I just rambled on...sorry guys. I get long winded on the air too LOL

no actually my HT is loaded with two AA alkaline batteries, it pushes a whopping 200 mW with fresh batteries. I can sit here in Napoleon and hit the Toledo machines the Lima Oh machines, and the Ft Wayne In. machines on a very regular occasion. Lets see now, Ft Wayne is roughly 65/70 miles from me, Lima is around 70 miles south of me, and Toledo is roughly 45 miles N.W. of me. I can hit these 24/7, and if the linked system in toledo hadn't been fried I could get into the 10m link there like Jim does in NY.

Oh BTW, it's all in the antenna not the power you push through it. Picked up a really awesom antenna at the wauseon hamfest last sunday.

And Tim I will not be a "No Code" forever, I am studying the code, I have the theory for general down tight, hell I have the theory down for extra. I just have this hearing problem that makes it hard for me to hear the code on the taped and cd's. Too many years travelling with bands playing large crowds, and too many years swinging hammers in small areas. Tinitus, and tone deaf.

I have never exchanged email from this person before, and as it was sent from a yahoo.com address, it was intentional. I have no clue as to who I might have pissed off or why they might be pissed at me, I have never been confrontational, I do stick up for my beliefs as is my right. But I have never been one to outright insult or degrade someone. And I will also admit when I make a mistake, ask anyone in this group who has ever corresponded via email with me, including twist, mopar, even dave. While I may disagree with them as far as the legalities of the way they pursue their hobbies, I have never blasted them for it. Sure I may have poked a bit of fun especially at dave, but I meant it as humor, I have a very strong sense of humor.

But all this aside, what was sent to me was downright malicious, and actions will be taken.

Ron I too long for the days when they licensed CB. I am a ham yes, but I got my start on 11m, I used to belond to a 11m ssb club, we only used legal 40 channels, met first sunday night of every month on 40 USB for a club net, and swap/shop net. We even had a 11m version of the hamfests that we held once a year in NW ohio.

I do believe that people should follow the rules, otherwise it would be anarchy and that just doesn't work out well. But I also do not go slamming my thoughts into others faces. I do like to join in technical discussions, I'll ask questions, and sometimes I have some advise to share myself.

Not all of us hams are bad. And at the same time there are many bad hams that don't come to this group. like any other group. there is good and bad in them all.

Keith, it could be that someone that you have exchanged emails or received a
forward from has exchanged email with this person. That's really all it
takes. Did you send a reply indicating that you received a virus from them?

the header in the mail i.e. the name who it was from, was from a regular
in this group, someone who I had never exchanged emaiuls with before.
Not only had I not exchanged emails with this person before, but it
turns out that someone in this group forged his name/email to send this
crap to me, so I am not sure if they were trying to get me, or if they

were trying to get the person they forged into trouble, either way it was not a very nice thing that I recieved in the mail, and I am not talking about the virus, viruses can be cleaned, I am talking about the sick image that was also sent. The police, as well as the FBI Cybercrime unit has been informed of this mail I recieved, and it has been removed from my system.

So Ron, you're the idiot on 39 AM? There's always got to be
some smart-alec that gets on AM on a sideband channel.

When you are ready, Keith, see the VEs. Aside from being good people,
they are required to make adjustments for physical problems. The Morse
Academy I recommend is tone adjustable and can be used to make a test at a
different tone. You might want to see the local ones anyway for whatever
their experience might be worth.

either pick up a 10m rig, or convert the cb to work on 10m and get a
10m/6m transverter that should meet your needs. Thats what I am going to
be doing, at least until I can save up the $$$ for a 706 or the FT-847.
I am kinda leaning for the FT-847, a friend of mine has one and it is
sweet.

Keith, the virus could be that someone has an infected computer. I know as I received an e-mail with an attachment from a trusted friend. When I went to open it, Zone Alarm went off and squashed it - even before my anti-virus software had the chance. I saved the attachment and scanned it - sure enough, a known virus. After deleting, I e-mailed my friend who traced it back to a friend of hers with an infected computer. The kiddie porn, however, would be EXTREMELY difficult to pass off as some kind of mistake. When you are dealing with any of the newsgroups, you will be certain to run into a few folks that never made it out of puberty. I strongly suggest a good firewall and a good anti-virus software. As to the kiddy porn, I'd tend not only to send it to the appropriate webmaster, but to the authorities as well. Yes, you can get away with the shootouts, but if it is pornography using underage kids, the individual, if caught, will NOT pass go; he will NOT collect $200. I can also bet that even if the webmaster doesn't care, a court order will produce any relevant documents - tracing back to the source.

> Ron
> YankeeBoy 323
> 27.395

And I too may have left a wrong impression. Yes, I did my 20 wpm for the FCC at an FCC office thirty years ago, BFD. I did not at the time think much more than 12 made a lot of sense for licensing then. The requirement is long obsolete, and as a dittybopper watching people learn it at 5 and have to unlearn to get to journeyman speed about 16-18 the 5 wpm test does more harm than good. Funny thing is that code is easier to learn at 16 than 6.

Having said that, it is not in my hands to change. It is simply a requirement. I hold a casualty insurance license for which I got to learn the wonders of Blue Water Marine which is mildly ridiculous in Nebraska but it is a requirement. So do it already and don't bleat about it.

My problem is not the code test but the almost ridiculous extremes that some will go to in avoiding one. I have been accused of everything except mopery with intent to gawk simply for having passed a code test. It gets older than the hills after while. And you are seeing the back side of the same coin.

Sounds good. You are, of course, using scatter for your non-skip communications. For the most part, what I've used is HT to HT or mobile through the repeaters. I've no idea what the maximum non-skip range would be, certainly not 150 miles. The 10 meter port is only 100 watts erp - which is certainly more than enough for worldwide F layer propogation. If I ever get back on HF (geeze, a couple of roofs, new carpeting, new boiler, new appliances, etc ... there are more places to spend money than make it!), it will be tough enough with the small lots and a LOT of horizontal wires all over the place. Cable and telephone wires 30 feet in the front, power lines from 100 feet in the back, and the satellite cable running about 50 feet along the house! I think I'm gonna be stuck with a lousy vertical. Oh well ... The rfi possibilities are almost staggering and I figure by going vertical, I'll cut most of the possibilities by 20 dB.

ROTFLMAO!
Again, You refer to me, you are so infatuated
with me, I'll bet you say my name in your sleep.
LMAO!!!!!!!!!

Sorry to disagree, but your wrong.
It's not a ham thing, it's a troll thing. Hams are
not the problem, it's the trolls. You must understand,
no matter Cb or ham, it's a troll problem. Most
of the hams here offer valuable years of knowledge,
it's just that some of the troll's think it's more fun
to make it a ham vs. a cb thing.
So please keep it a troll verse's Cb'er thing,
not a ham verse's Cb'er thing.

Using the same logic that led you to believe that I am Voobner? Hasn't
that kind of thinking gotten you spanked enough already?

FYI, Keith and I may disagree on some topics, but I show respect for
the man because he, unlike you, has done nothing to cause me to
disrespect him. Regardless, I don't send viruses (virii?) to -anyone-
for the simple reason that I don't have any on my computer and I would
like it to stay that way. It's called the golden rule, Randy. Maybe
you missed it while you were growing up.... or maybe you just haven't
grown up yet. Regardless, it goes something like this:

If you kick somebody in the face, don't cry when they kick you back!

Hello Rob,

Personally, I'd buy a cheap mag antenna from Radio Shack, if it's only for work purposes, at least this way if something goes wrong at the job site and it breaks/or if someone steal's the antenna, it would be cheap to replace.

Just my 2ï¿½ worth!

How about mentioning who used that as a "sig" file.
Does your pal Georgina get a mention... huh.

So, either you are calling him a Troll for using that
as a sig file, or you are a hypocrite... your choice.

Braiunbuster.

Hi Kieth.

Just remember that the "sender" may not even know about it as a virus usually
sends itself, and some of them even "spoof" the e-mail address to avoid the
source being found and the user being warned.
So the address in the header may not be the source of the e-mail.

I recently received an e-mail from one of the net3media systems, claiming
that I sent them a virus. I checked the IP number, and it checked out as one
of their e-mails. At the time, I had not been on line for several days (the
PC
is totally disconnected while off-line and I don't know of a virus that can
get
out the PC and plug the computer back into the telephone line).
I still did a full scan and found nothing. The virus was known for spoofing
and had taken my e-mail details from the users address book. Someone
